

MPE V Tables Manual for MPE V/E, Version G.00.00

HP 3000 Computer Systems

**MPE V TABLES MANUAL
for MPE V/E, Version G.00.00**

19447 PRUNERIDGE AVENUE, CUPERTINO, CA 95014

CAUTION

The normal checks and limitations that apply to the standard MPE users are bypassed in Privileged Mode. It is possible for a Privileged Mode program to destroy file integrity including the MPE operating system software itself. Upon request Hewlett-Packard will investigate and attempt to resolve problems resulting from the use of Privileged Mode code. This service is available on a time and materials billing basis. However, Hewlett-Packard will not support, correct, or attend to any modifications of the MPE operating system software.

NOTICE

The information contained in this manual is proprietary and may not be disclosed to third parties. The terms and conditions of release of this information to the recipient are governed by the agreement executed at and between Hewlett-Packard and the recipient regarding the HP 3000 internal MPE V System Table Structures, including the MPE V Tables Manual for MPE V Operating System.

Hewlett-Packard does not warrant the accuracy or completeness of the information contained in this manual. Hewlett-Packard may make revisions to the MPE operating system or CPU firmware that may affect the information and specifications contained herein. Hewlett-Packard shall have no obligation to provide the recipient with notification of revisions, corrections, or updates regarding the information contained herein.

Hewlett-Packard shall not be responsible for any loss or damage to the recipient, its customers, or any third party caused by the recipient's use of the information provided herein.

LIST OF EFFECTIVE PAGES

The List of Effective Pages gives the date of the current edition, and lists the dates of all changed pages. Unchanged pages are listed as "ORIGINAL". Within the manual, any page changed since the last edition is indicated by printing the date the changes were made on the bottom of the page. Changes are marked with a vertical bar in the margin. If an update is incorporated when an edition is reprinted, these bars and dates remain. No information is incorporated into a reprinting unless it appears as a prior update.

First Edition September 1984

Effective Pages	Date
-----------------	------

ALL	SEP 1984
---------------	----------

PRINTING HISTORY

New editions are complete revisions of the manual. Update packages, which are issued between editions, contain additional and replacement pages to be merged into the manual by the customer. The date on the title page and back cover of the manual changes only when a new edition is published. When an edition is reprinted, all the prior updates to the edition are incorporated. No information is incorporated into a reprinting unless it appears as a prior update.

The software date code number printed alongside the date indicates the version level of the software product at the time the manual edition or update was issued. Many product updates and fixes do not require manual changes, and conversely, manual corrections may be done without accompanying product changes. Therefore, do not expect a one-to-one correspondence between product updates and manual updates.

First Edition SEP 1984 G.00.00

CONTENTS

PREFACE	xix
-------------------	-----

CHAPTER 1 MEMORY LAYOUT

Fixed Low Memory (Series 44/48/64/68)	1-1
System Global Area	1-3
SysGlob Extension	1-14
SYSDB Words	1-17
SysGlob Word Definitions	1-17
Allow Mask Format	1-18
Logging Related Locations	1-20
FLAGX	1-20
Process Stop List General Layout	1-21
Entry Format	1-21
Preassigned Entries	1-21
Initial Memory Allocation	1-22
Bank 0	1-23
Bank 1	1-24

CHAPTER 2 MEMORY MANAGEMENT TABLES

Segment Table Structure	2-1
Pointers and DST #'s of Segment Table Components	2-2
Standard Object Identifier Format	2-3
DST Entry Formats	2-3
CST Entry Formats	2-5
ST Entry Field Descriptions	2-6
CSTBLK Format	2-6
Program Blocks and the CSTXMAP	2-7
CST Extension Block Entry Format	2-7
Fixed DST Entry Assignments	2-8
Swap Tables	2-11
SWAPTAB Entry 0 Format	2-11
SWAPTAB Unassigned Entry Format	2-12
Segment Locality Lists (SLL)	2-13
SLL Header Format	2-14
SLL List Entry Format	2-15
Special Request Table	2-16
Main Memory Region Headers and Trailers	2-18
Global Region Trailer	2-19
Global Region Header (Available Regions)	2-19
Subregion Header (Available Regions)	2-20
Global Region Header (Reserved Regions)	2-21
Subregion Header (Reserved Regions)	2-22
Subregion Header (Cached Regions)	2-23
Region Header and Trailer Field Descriptions	2-24
Space Allocation Structures	2-26

CHAPTER 3 DISC LAYOUT

System Disc Layout	3-1
Disc Label (Sector 0 of Disc)	3-4

CONTENTS (Continued)

System Volume	3-4
Serial Volume	3-6
Master Volume	3-8
Slave Volume	3-10
Defective Tracks Table (Sector 1 of Disc)	3-12
Defective Sector Table (DSCT -- Sector 1 of Disc)	3-13
Reserved Area Bit Map (Sector 4 of the System Disc)	3-14
Disc Cold Load Information Table (Sectors 28-30)	3-15
INITIAL Program CST Map	3-20
SYSDUMP/INITIAL Communication Record	3-21
Cold Load Information Table Extension	3-23
Virtual Disc Space Management Structures	3-24
Virtual Disc Space Management Table	3-24
General Structure	3-24
VDSMTAB Entry 0 Format	3-25
VDSMTAB General Entry Format	3-26
Volume Table	3-27
Typical Private Volume Entry	3-28
Typical System Volume Entry	3-29

CHAPTER 4 DIRECTORY

Introduction to the Directory	4-1
Overview of Directory	4-2
Directory Data Segment	4-3
Directory Pointer Area [DA or DB] DST=20(10)	4-5
Directory Space Data Segment (DIRSDS)	4-6
Directory Structure	4-10
Directory Definitions	4-11
Index Block Prefix (10 Words)	4-11
Index Entry (6 Words)	4-12
Account Entry (%36 Words)	4-12
Group Entry (51% Words)	4-14
File Entry (File Pointer) (6 Words)	4-16
User Entry (19 Words)	4-17
User Attributes/Capabilities	4-18
Volume Set Definition Entry	4-19
GVSLINKAGE	4-20
GVSINFO	4-20
GVSVOLFLAGS	4-20
GVSVOLINFO	4-20
Volume Set Class Entry	4-21
GVCLINKAGE	4-22
GVCINFO	4-22
Volume Mask Format	4-22

CHAPTER 5 LOCK RESOURCES

SIR# Allocation DST %53	5-1
Sir's Ordered by Sir Number	5-1
Sir's Ordered by Ranking	5-2

CONTENTS (Continued)

SIR Table Information	5-3
SIR Entry Formats	5-4
RIN Table General Layout (Initialized State)	5-5
Allocation and Locking of Local RINS	5-6
Allocation and Locking of File RINS	5-7
Allocation and Locking of Global RINS	5-8

CHAPTER 6 FILE SYSTEM

File System Overview	6-1
Buffers	6-2
Table Formats	6-3
File System Section of PCBX (PXFILE)	6-3
Overhead	6-4
PXFILE Control Block Table (PXFCBT)	6-6
Available Block	6-6
Active File Table (AFT)	6-7
File Control Block Table (CBTAB)	6-2
Overhead	6-13
Vector Table	6-15
Control Block Area	6-17
Access Control Block (ACB)	6-18
Logical Access Control Block (LACB)	6-19
Physical Access Control Block (PACB)	6-21
File Control Block (FCB)	6-37
File Label (FLAB)	6-43
File Multi-Access Vector Table (FMAVT) DST(%54)	6-52
Zero Entry Format	6-52
Typical Entry Format	6-53
System Global Area (SYSGLOB)	6-54
SIRs, Locks, and Deadlocks	6-54
Shared CBT DST	6-55

CHAPTER 7 PROCESS TABLES

Process Control Block Table Structure and Format	7-1
Fixed Cells Related to PCB	7-1
PCB Entry 0 Format	7-2
Unassigned PCB Entry Format	7-3
Assigned PCB Entry Format	7-4
PCBX Structure and Format	7-8
PCBX General Structure	7-8
PXGLOB Format	7-9
PXFIXED Assignments	7-10
PXFIXED Expansion Bitmap	7-14
PCBX For Core Resident System Process Stacks	7-15
Process To Process Communication Table	7-16
Subsystem Reserved DL Area	7-17
FORTRAN Logical Unit Table (FLUT)	7-18

CONTENTS (Continued)

CHAPTER 8 JOB TABLES

Job Tables Overview	8-1
Job Master Table Structure (JMAT)	8-2
Job Master Table Entry (JMAT)	8-4
Job States	8-6
Job Process Count Table (JPCNT)	8-7
Job Cutoff Table (JCUT)	8-8
Job Information Table (JIT)	8-9
Allow Mask Format	8-11
Job Directory Table (JDT)	8-14
Job Data Segment Directory Entry (In JDT)	8-15
Job Temporary File Entry (In JDT)	8-15
File Equation Table Entry (In JDT)	8-16
Job Line Equation Entry	8-17
Job Control Word Table (JJCW)	8-18
Aoptions and Foptions Word Breakdown	8-19
PMASK Word Breakdown	8-20
UCOP Request Queue (DST#9)	8-21
UCOP Entry Format	8-22

CHAPTER 9 RELOCATABLE OBJECT CODE

USL Files Introduction	9-1
Record 0 and Overall USL File Format	9-1
Data Descriptors, Passed Parameters	9-5
Pascal	9-5
Entry Type 0	9-6
Entry Type 1	9-6
Entry Type 2	9-8
Entry Type 3	9-11
Entry Type 4	9-11
Entry Type 5	9-14
Entry Type 6	9-15
Entry Type 7	9-17
Entry Type 8	9-19
Entry Header Format	9-21
Header Type 0	9-22
Header Type 1	9-22
Header Type 2	9-23
Header Type 3	9-23
Header Type 4	9-24
Header Type 5	9-24
Header Type 6	9-25
Header Type 7	9-25
Header Type 8	9-26
Header Type 9	9-27
Header Type 10	9-29
Header Type 11	9-29
RL File Format	9-30
Storage Management	9-31

CONTENTS (Continued)

Entry Point Directory	9-32
Typical Directory Entry	9-33
Procedure Information Block	9-34
Headers	9-35

CHAPTER 10 PREPARED OBJECT CODE

Program File Format	10-1
Flags	10-3
Flags2	10-4
CST Remapping Array	10-4
Segment Descriptor Array	10-4
Global Area Format	10-4
External List	10-5
Entry Point List	10-6
Code Segment With Patch Area	10-7
Patch Area	10-7
PMAP Information	10-8
PMAP Type Table	10-8
PMAP Records	10-9
Type 0 Segment PMAP Record	10-9
Type 1 Procedure PMAP Record	10-9
Type 2 Secondary Entry PMAP Record	10-10
SL File Format	10-11
Storage Management	10-13
Entry Point Directory	10-13
Typical Directory Entry	10-14
Code Segment Linkage Structure	10-15
Reference Table Structure	10-17
Reference Table (256 Maximum Entries)	10-18
Code Segment With Patch Area	10-19
PMAP Information	10-20
PMAP Type Table	10-20
PMAP Records	10-21
Type 0	10-21
Type 1	10-21
Type 2	10-21

CHAPTER 11 LOADER

MPE Loader	11-1
Loader Segment Table Overview	11-1
LST Overview	11-1
XLST Overview	11-2
Loader Segment Table Primary DB	11-3
Directory Entries	11-4
Loader Cache	11-10
Cache Data Segment Format	11-10
Bucket Format	11-10
Loader Communication Table (LCT)	11-11

CONTENTS (Continued)

Form Incoming to Loader (Load/Allocate Program)	11-11
Form Incoming to Loader (Load/Allocate Procedure)	11-12
Form Returned (No Error)	11-13
Form Returned (Error Occurred)	11-13
Logical Segment Transform Table (LSTT)	11-14

CHAPTER 12 PRIVATE VOLUMES / SERIAL DISC

Mounted Volume Table (MVT AB)	12-1
Private Volume User Table (PVUSER))	12-4
Bind Names Data Segment	12-6
Serial Disc Tables and Data Structures	12-8
Data Record Format	12-8
End of File Format	12-9
Contiguous Block Format	12-10
Hole Format	12-10
Gap Table Format	12-11
SDISC Extra Data Segments	12-13
Serial Disc Organization	12-15

CHAPTER 13 I/O

I/O Table Linkage	13-1
Device Reference Table (DRT)	13-2
Driver Linkage Table (DLT)	13-3
Logical-To-Physical Device Table (LPDT)	13-4
Entry 0	13-5
Typical Entry (Virtual Devices)	13-5
Typical Entry (All Real Devices)	13-6
Entry for Terminal-Like Devices	13-7
Entry for Tape Drives	13-7
Entry for Disc Drives	13-8
Logical Device Table (LDT)	13-9
Overview of Data Segment	13-9
Zero Entry Format	13-9
Typical Entry Format	13-10
Logical Device Table Extension (LDTX)	13-11
Overview of Data Segment	13-11
Zero Entry	13-12
Typical Entry	13-12
Terminal Entry	13-13
Serial or Foreign Disc Entry	13-14
CIPER Entry	13-14
System or Private Volume Disc Entry	13-14
Device Class Table (DCT)	13-15
Overview of Data Segment	13-15
Header Entry Format	13-15
Typical Entry Format	13-16
Discussion	13-16
Interrupt Linkage Table (ILT)	13-18

CONTENTS (Continued)

Device Information Table (DIT)	13-20
DIT for HP-IB Systems	13-20
DIT Terminology for HP-IB Systems	13-21
Device Information Table (DIT) for CIPER	13-21
DIT for Channel Devices	13-24
DIT For 7905/7906/7920/7925	13-26
Error and Retry Information	13-28
CS 80 Disc Device Information Table (DIT)	13-29
DIT For 7970 Magnetic Tape	13-32
DIT for 7976 Magnetic Tape	13-34
Card Reader DIT	13-37
Card Reader DIT Field Definitions	13-38
Device Information Table for HP-IB Card Reader	13-39
2608 Line Printer DIT (HP-IB Systems)	13-41
2608 Line Printer Status	13-43
2631 or 2619A Line Printer DIT (for HP-IB Systems)	13-44
2680A/2688A DIT	13-46
I/O Status Block	13-48
Disc Request Table and Disc Requests	13-51
DISCREQTAB	13-51
Disc Request Table	13-52
Disc Request Table Entry 0 Format	13-52
Disc Request Element Format	13-53
IOQ Table Layout	13-56
I/O Queue Element (IOQ)	13-58
I/O System Status Returns	13-60
I/O Queue Element for 7976A Magnetic Tape	13-62
I/O Queue Element (IOQ) for CIPER	13-64
HP-IB CIPER Physical Driver Request Codes	13-65
CIPER Driver Return Status Codes	13-65
2608 Line Printer I/O Queue Element (HP-IB Systems)	13-66
2608 Line Printer Request Codes	13-69
2619A & 2631 Line Printer IOQ Element (HP-IB Systems)	13-70
2619 Line Printer Request Codes	13-73
2631 Line Printer Request Codes (HP-IB Systems)	13-74
I/O Queue Element For HP-IB Card Reader	13-75
CS 80 Disc Request Queue Element (IOQ)	13-77
CS 80 Integrated Cartridge Tape Request	13-80
SBUF Table Layout	13-83
Table Element Allocation (SBUF)	13-84
ICS Global	13-86
ICS Global Cells With Initial Values	13-89
CS 80 Disc Interrupt Linkage Table (ILT)	13-90

CHAPTER 14 SPOOLING

Input Device Directory/Output Device Directory	14-1
Overview of Table Structure	14-1
Entry 0 (Overall Table Definitions)	14-2

CONTENTS (Continued)

Typical Head Entry (4 words)	14-3
Typical Subentry (%40 words)	14-4
SPOOK Tape Format	14-6
Label Record	14-6
File Directory	14-7
Device and Class Directory	14-7
Logical Device Entry	14-7
Device Class Entry	14-8
Spoolfile Format	14-8
Spoolfile Block Format	14-8
Spoolfile Record Format	14-8
User Labels Information	14-9

CHAPTER 15 UNIFIED COMMAND LANGUAGE (UNCL)

Reply Information Table (RIT)	15-1
Message System General Description	15-2
Message Catalog	15-3
MAKECAT Program	15-4
Message System CATALOG.PUB.SYS	15-5
Message Set Directory	15-6
HELP Subsystem	15-7
UDC Directory	15-8
UDC's COMMAND.PUB.SYS	15-9
CI Stack Definition	15-11
Field Definitions	15-12
Association DST Layout	15-13

CHAPTER 16 SYSDUMP/INITIAL

CONFDATA File	16-1
Record 0 of CONFDATA File (CTAB0)	16-1
Record 1 of CONFDATA File (CTAB)	16-2
DEVDATA.PUB.SYS	16-4
Overview	16-4
Parameter Record	16-4
Driver Table	16-6
SYSDUMP Format	16-7
WSC Table Format	16-9
Series 64/68 WCS Table Format	16-9
Store Tape Format	16-10
First Volume	16-10
Subsequent Volumes	16-12
End of Volume	16-13

CHAPTER 17 MISCELLANEOUS

Labeled Tape Subsystem	17-1
Tape Label Table	17-5

CONTENTS (Continued)

Volume Recognition	17-10
Opening a File	17-10
Reading and Writing Files	17-10
Closing Files	17-11
Store-Restore	17-11
Miscellaneous	17-11
Breakpoint Table	17-12
PCB Breakpoint Extension Table	17-13
Breakpoint Entry Table	17-13
Active Entry	17-14
Timer Request List (TRL)	17-17
MPE User Logging	17-19
General Design Overview	17-19
Hardware Environment	17-19
Software Environment	17-19
Design Narrative	17-19
Error Recovery Description	17-20
Design Structures	17-21

PREFACE

This manual describes the internal table organization of the MPE V operating system, release G.00.00. The Tables Manual is an informational reference for the technically sophisticated user with Privilege Mode capability. We strongly discourage modifying the table structure because you may destroy the operating system. The following caution applies:

CAUTION

The normal checks and limitations that apply to the standard MPE users are bypassed in Privileged Mode. It is possible for a Privileged Mode program to destroy file integrity including the MPE operating system software itself. Upon request Hewlett-Packard will investigate and attempt to resolve problems resulting from the use of Privileged Mode code. This service is available on a time and materials billing basis. However, Hewlett-Packard will not support, correct, or attend to any modifications of the MPE operating system software.

The table structure of MPE V is significantly expanded from MPE IV. The operating system reflected in the table structure is the Fundamental Operating Software (FOS) version of MPE V. Your table structure may look different depending on the applications and uses of your system.

The information is presented in several different formats. This reflects the combined knowledge of several divisions and groups within Hewlett-Packard. Instead of taking the time to consolidate all the various formats, we chose to release the information quickly.

We hope you will find this edition informative. Your comments and suggestions are welcome via the "Reader Comment Sheet" at the back of this manual.

SYSDB Words

System tables may be accessed by using the LST/SST instructions. Pointers have the following format:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Address										Bank					

Address is the whole word with "Bank" masked out to 00000.

Systems that have MPE V/E microcode (all 6K systems, 4K systems with new boards) can have a non-zero bank number. Systems running pre-MPE V/E microcode can only use bank 0, therefore the pointer will look like:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Address															

SysGlob Word Definitions

ADDRESS	NAME	FUNCTION
DB+55	BUSY	- SYSDB relative pointer to BUSY TABLE for I/O resources
DB+56	HEAD	- SYSDB relative pointer to table containing head pointers to I/O resource queues
DB+57	TAIL	- SYSDB relative pointer to table containing head pointers to tail of I/O resource queues
DB+60	SID COUNT	- Number of I/O Programs currently executing
DB+72	POWER FAIL	- 0-no power fail 1-system disc recovery 2-all other disc recovery 3-all other device recovery
DB+73	SYSUP	- System is up and operable
DB+74	CONSLDEVN	- System console logical device number
DB+400	CPU NUMBER	- Set when system aborts

G.00.00
1- 17

Memory Layout

JOBSYNCH job synchronization via jobsynch (sysglob+121(B))

(13:1) - JOBSAERDY - set by DEVREC & MORGUE (via procedure STARTDEVICE) indicating a ready job. This prevents UCDP from going to a wait state when a job is just made ready.

(15:1) - DEVFREED - set by DEALLOCATE when device count goes to 0.

NOTE - Both bits above used for synchronization of job-made-ready or devicefreed when UCDP is running.

(14:1) - JOBSWAITING- set by UCDP just before waiting if any job is waiting for list device. Signals DEALLOCATE to awake UCDP when a device is freed.

Allow Mask Format

The Allow mask for MPE V is expanded to six words. There is a mask in each user's JIT and in the SYSGLB area. The Allow mask contains enough bits for a one-to-one correspondence to every present OPERATOR type command, or any future OPERATOR command. When a user is ALLDed any OPERATOR command or ASSOCIATED to a device (which will use OPERATOR type commands) then the corresponding bit(s) in the mask in that user's JIT for that command is set. If the ALLOW or ASSOCIATE was done on a global scale, then the bit(s) in the mask of the SYSGLB area is/are updated.

The following EQUATES define the mask bit for each operator command.

The first set of commands define the operator commands dealing with devices.

When adding a new command to this set of EQUATES, be sure to add a corresponding move statement in LOGIMAGE, even if the command will not be logged.

Word	Bit	#

Initial Memory Allocation

This section is a description of the method used by INITIIRL to allocate memory for MPE tables and code segments in MPE V/E. All memory allocated by INITIIRL is permanently allocated. All non-core resident code and data is put on disc before exiting INITIIRL.

At the most basic level INITIIRL will try to build memory to look exactly as diagrammed below. There are, however, several ways in which to deviate from this structure. Before going into the sources of these deviations, it is necessary to point out which portions of memory are used by INITIIRL during the restart and therefore cannot be used by MPE until INITIIRL has finished.

Before INITIIRL begins to allocate any memory space, it relocates its core resident code, its code segment swapping area and its stack to the highest configured memory space. Additionally, it uses the last 2326 words of bank 0 on series 4x machines for its I/O buffer area and temporary code segment table. After INITIIRL has built all of core resident MPE (tables and code), it builds the disc resident MPE tables. Since some of the disc resident tables may be too large to be built in INITIIRL's stack, these tables are built in unused memory space. Therefore, in addition to the memory space required for INITIIRL's code, INITIIRL's stack and core resident MPE, there must be enough space left in which to build the largest of the disc resident tables.

For Series 6x machines with the MPE V/E firmware, INITIIRL will build the tables with ">" signs by them out of Bank 0 if necessary. For all other tables, INITIIRL will essentially build memory in the order shown below. There may be an unused fragment of memory between the DRT's and the system global area which INITIIRL will fill with the smaller tables. Neither the tables marked with an asterisk nor the code segments will ever be put in this area. NOTE: INITIIRL will build all tables on 32-word boundaries.

If the system being built by INITIIRL is configured with 128K words or 160K words of memory then INITIIRL's stack will be in bank 1 (the code also on a 128K word memory size). If INITIIRL is occupying part of bank 1 and the space is needed for a core resident MPE code segment or to build a disc resident table then INITIIRL will print the error message "ERROR M350 OUT OF MEMORY".

Except for the exceptions stated above, for every allocation of memory INITIIRL will first try to allocate any remaining space between the DRT's and SYSDB. It will then try the next available space in bank 0, then the next available space in bank 1. If it were necessary it could continue searching until all all banks were checked for available space.

Immediately before exiting INITIIRL, INITIIRL lays down all the memory region headers and trailers as shown below. For any one bank of memory there will only be one block of core resident MPE, regardless of its contents. The only block of core resident MPE that does not have a reserved region global header is in bank 0. It does have the reserved region global trailer though. Before placing any code outside bank 0 the first 24 words of every bank (except bank 0) is reserved for the region global header.

CHAPTER 2 MEMORY MANAGEMENT TABLES

Segment Table Structure

The current location and state of each data segment and loaded code segment is maintained in the Segment Table. This table is partitioned into three separate tables as shown in Figure 2-1. The partitions are based on the segment classes: a segment is a data segment, a segment is a system SL segment, or a segment is part of a program. The structure and format of each partition is described in the following.

Overall ST Structure

G.00.00
2- 1

Pointers and DST #'s of Segment Table Components

i. DST

X 2 absolute address of entry 0 of the DST. X1002 sysbase relative index of entry 0 of DST. DST number 2 is the DST Table dst #.

ii. CST

X 0 absolute address of entry 0 of System SL. X1001 sysbase relative index of entry 0 of System SL. X1032 displacement from DST base of entry 0 of System SL (i.e. @CST(last) - @DST(0) = OFS). DST number 4 is the CSTX Table DST #.

iii. CSTX

X 1 absolute address of entry 0 of current program. X1033 displacement from DST base to first CSTX entry SL. DST number 4 is the CSTX Table DST #.

iv. CSTXMAP

X1051 sysbase relative index of entry 0 of CSTXMAP. DST number 43 (X72) is CSTXMAP Table DST #.

2- 5ST Entry Field Descriptions

R = 1 ==> segment absent
 M = 1 ==> segment privileged
 R = 1 ==> segment has been referenced
 T = 1 ==> segment is being traced
 DCV = 1 ==> disc copy is valid
 STK = 1 ==> segment is a stack
 MOD = 1 ==> a segment modification (exp., contr.) is pending
 FWIP = 1 ==> a forced write of this segment is in progress
 VMPPGECNT = # of virtual memory pages allocated to this segment
 ROC = 1 ==> segment is recoverable overlay candidate
 IMI = 1 ==> segment is in motion in
 SYS = 1 ==> segment is a system segment
 CORE = 1 ==> segment is core resident
 WD = 1 ==> write disabled

CSTBLK Format

CSTBLK(0)		
0	NUMBER OF ENTRIES IN TABLE	*
1	RNY UNASSIGNED ENTRY = -1	*
2	RNY ASSIGNED ENTRY > 0	*
3	REMAINING CSTBLK TABLE ENTRIES	*

The table is initialized to minus one in each entry. When selected, the entry is replaced by a DST-relative index to the entry W0 of the CST extension block. This is the overhead entry for the associated program.

6.00.00
2- 6Program Blocks and the CSTXMRP

Since programs can be dynamically loaded and unloaded, the segment table must be kept packed or fragmentation would occur. Thus, the block of ST entries for a program segment begins at an ST entry number that changes if a program which was loaded before it gets unloaded. To manage this dynamic structure, an auxiliary structure, the CSTXMRP is used. A program is identified by its index, CSTXEIX, into this map. The program's current beginning physical ST entry number is equal to equal to CSTMRP (CSTXEIX).

Entry Format - CST Extension Block

CSTXMRP(CSTXEIX) ->		
0	* N = # OF CST'S IN BLOCK	*
1	* VALIDITY=X125252	*
2	* N OF USERS SHARING BLOCK	*
3	* 0	*
KCST		NON-KCST
1	* HRS CST ENTRY FORMAT	* <--- X301
2	* HRS CST ENTRY FORMAT	* <--- X302
*N	* HRS CST ENTRY FORMAT	* <--- X303

The value of CSTXEIX is established when a CST extension block is allocated. This index into the array CSTXMRP is maintained in the PCB of each process sharing the block.

An assigned entry in the swaptab is a process' SLL header or a member of a process' SLL. These formats are now described.

G.00.00
2- 12

Segment Locality Lists (SLL)

The system maintains for each process a segment locality list (SLL) of the segments belonging to that process' current working set. The process' SLL consists of a header and a list of entries. The header and list entries are taken from the SWAPTRB.

R process' SLL is located via the process' PCB entry. PCB01 contains the SLL relative index of the process' SLL header.

G.00.00
2- 16

The following entry format is for data segment size changes:

0	NEXT ENTRY FOR DATA SEGMENTS
1	OBJECT IDENTIFIER
2	NEW DATA SEGMENT SIZE
4	READ DISPLACEMENT
5	MOVE COUNT

The following is the format for devices waiting on a segment: (The region header for the segment contains an SRT relative index to this entry. If more than 5 devices are waiting on this segment, another entry will be linked to this entry.)

0	NEXT ENTRY OF QUEUED DEVS ON SEG
1	IDQINX
2	IDQINX
3	IDQINX
4	IDQINX
5	IDQINX

NOTE:

The number of primary configured entries will be equal to the total number of LDEVs configured. The number of secondary entries will be configured to be at least the same as the number of PCBs configured. Data segment change entries are secondary type, while devices queued entries will be primary entries.

G.00.00
2- 17

Main Memory Region Headers and Trailers

Main memory is partitioned into regions. Each region is in one of three states: available, reserved, or assigned.

An available region is available for consumption by the free space allocation mechanism. An available region consists of neighboring subregions, each of which is either a hole or an overlay candidate. An available region is linked into the available region list.

A reserved region is a main memory region which is in the transition state from available to assigned. A reserved region has been cleaned, and there is a pending disc read of a segment into the region.

Assigned regions are occupied by present segments. Available and reserved regions consist of one or more adjacent subregions. Region headers and trailers are partitioned into global and local components. The global region header/trailer is only valid for the first/last subregion in regions consisting of more than one subregion.

The region headers and trailers of available, reserved, and assigned regions contain the state and control information pertaining to the current or planned contents of the region.

Cache domains are another form of assigned regions and are designated as such in the subregion header. If the cache domain is "mapped" - has I/O pending against it - then the object identifier will have a non-zero value in the second word of the segment identifier field. If the second word of the segment identifier field is zero, then this region is a cache domain that is unmapped. (Refer to Chapter 23 for further information regarding Disc Caching.)

Region Header and Trailer Field Descriptions

RRS,	Region Assignment State
	.(0:1) Region Assigned Flag
	.(1:1) Region Reserved Flag
	.(2:1) Region Available Flag
	.(3:1) Region Cleaned Flag
	.(4:1) Size Change Pending Flag
	.(5:1) Region Locked Flag
	.(6:1) Region Frozen Flag
	.(7:1) Region I/O Frozen Flag
	.(8:1) LSTT segment
	.(9:6) Not used
	.(15:1) Blocked Lock Migration in Progress Flag
IOCR,	Dn-Going I/O Count
	= N of dn-going I/O's in the region which must complete before the initiation message can be processed.
INITMSG,	Initiation Message
	.(0:1) Message Processed Toggle Switch
	.(1:1) Message Externally Disabled Flag
	.(2:1) Message On-going I/O Disabled Flag
	.(3:1) Queue Segment Read Disc Request Flag
	.(4:1) Incore Move Request Flag
	.(5:1) Expansion Request Flag
	.(6:1) Garbage Collection Flag
	.(7:1) Message Aborted Flag
	.(8:1) Release Residual Pages Flag
	.(9:1) Ok to start completion flag
	.(10:5) Not used
	.(15:1) Message Valid Flag
INITINF,	Initiation Message Auxiliary Information
	= DRQ relative index of segment read disc request if INITMSG.
	ORADREQ=1
	or
	= +/- Displacement to initiation message for moves and expansions.
COMPMSG,	Completion Message
	.(0:1) Message Processed Toggle Switch
	.(1:1) Segment Modification Required
	.(2:1) Block Lock Request
	.(3:1) Send Scheduler A Message
	.(4:1) Reopen A Device
	.(5:1) Message Aborted
	.(6:9) Available
	.(15:1) Message Valid Flag

G.00.00
2- 24

Memory Management

MPQLINK PCB relative index of the HEAD of the nake present queue.

PAGECNT, Release Page Count
= # of extra pages to release before processing initiation message.

SPECREQTBPTA, A Special Request Table relative index to the list of devices queued on this segment.

SRS, Subregion Assignment State
.(0:1) Cached region
.(1:1) Referenced
.(2:1) Recover Overlay Candidate
.(13:3) I/O Status from region fetch

SS, Subregion Size

SD, Subregion Displacement
.(0:1) Displacement Count Valid Flag
.(1:15) # Pages to Base of Region

WREQP, Write Request Pointer
= DRQ Relative Index of Disc Write Request when the Data Segment in the Subregion is in Motion Out
When the region belongs to a cached domain which is napped (i. e. OBJIDENT = 30000/non zero number) this word is non zero. If the cached domain is not napped WREQP is zero.

OBJIDENT, Object Identifier- has standard object identifier format

LKFZCNT, Lock and freeze count
.(0:8) Number of times region has been frozen
.(8:8) Number of times region has been locked

IOFZCNT, Iofreeze count
.(0:8) Not used
.(8:8) Number of times region has been io frozen

For regions belonging to cached domains, the above two words contain the absolute address of the PD field in the previous region belonging to a cached domain.

NDDR, High order disc address in virtual memory of this region

LODR, Low order disc address in virtual memory of this region

ND, Next cached domain link for cached domain regions only. Contains the absolute address of the ND field of the next cached region. (2 words)

G.00.00
2- 25

Memory Management

ARRTIME, Arrival time, contains the time at which the segment contained in the region became present

CACHEDISP Valid only for regions containing a cached domain, this word represents the disc address (in one word) of the segment contained in the region. This word which exists in each member of a linked list of cached domains, is used as the target word during the LLSN instruction.

Space Allocation Structures

As of MPE V/P and V/E, one doubly linked list structure is used instead of the multiple lists ordered by size as in MPE IV. Sysglob locations Z250 through Z253 contain the respective head and tail (bank & address) of the available region list. These four words have in essence replaced the ARSBM and ARL data structures in MPE IV. Memory allocation and deallocation is handled through PUTONARL and TAKEOFFARL. The search for an available region of the desired size is done via the LLSN instruction. The format of the list is the following :

Sysglob Z250 & Z251 points to the absolute address of the NEXT LINK field (two words) in the first available region on the list. The NEXT LINK field in the first available region points to the absolute address of the NEXT LINK field in the second available region and so on. It is worth mentioning that in addition to having a NEXT LINK field, each available region also contains a PREVIOUS LINK pointer, which makes management of the list both easier and faster.

Defective Sector Table (DSCT -- Sector 1 of Disc)

(the DSCT exists on device type 3 (CS-90) discs)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	NUMBER OF ENTRIES IN THE TABLE															0
X1	INDEX TO THE FIRST ENTRY (6)															1
X2	ENTRY SIZE (2)															2
X3	MAXIMUM NUMBER OF ENTRIES (61)															3
X4	0 (RESERVED)															4
X5	0 (RESERVED)															5
X6	FIRST DEFECTIVE SECTOR ENTRY (DOUBLE-WORD LOGICAL SECTOR ADDRESS)															6
X10	SECOND ENTRY															8
X12	THIRD ENTRY															10
	.															
	.															
X176	MAXIMUM DEFECTIVE SECTOR ENTRY															126
X177																127

Unlike the DIT, entries in the DSCT are not permanent. Once a suspect sector is handled by INITIAL or VINIT, its entry is removed from the table. Thus, this table contains only unprocessed suspect sectors.

G.00.00
3- 13

Reserved Area Bit Map (Sector 4 of the System Disc)

The first 400 sectors of the system disc are reserved for Initial's use. This area contains permanent data structures for the boot. It is also used as a temporary storage area for data during sparing. All other system volumes and private volumes reserve only the first 10 sectors of the disc. They do not have a reserved area bit map.

The bit map contains 1 bit per sector. A '1' means the sector is free.

Cold Load Information Table Extension

The Cold Load Information Table Extension is a part of the Cold Load Information Table that has no use in booting the system. It exists for different system level processes to hold information that would only be created during a RELOAD. A good example of this is the system log file number. This is only created on a RELOAD, and changed whenever a log file is full or a boot (other than a RELOAD) is performed.

In order to protect the Cold Load Info Table, the extension was created. In this way NO I/Os should be performed to the Cold Load Information Table during MPE operation. However to process data into the Cold Load Info Extension a process must use the access routine "PROCESS'COLD'LOAD'INFO". The exact calling sequence can be found in KERNEL.

The Cold Load Information Extension is 2 sectors long and immediately follows the SYSDUMP/Initial Communication Record starting at sector address #31 on logical device 1.

Virtual Disc Space Management Structures

Disc space for data segments is allocated from reserved regions of system volumes which have been assigned the virtual memory supporting (VMS) attribute. The data structure used for accounting and management of the virtual disc space of the various VMS volumes is the Virtual Disc Space Table (VDSMTAB). This structure consists of a circular list of entries, one for each VMS volume. Each entry contains the information defining the state of the virtual memory region on that volume.

CHAPTER 4 DIRECTORY

Introduction to the Directory

SYSGLOB cells:

DIRBASE <----absolute disc addr of base [SYSGLOB+X130 AND X131]

Directory on disc consists of a contiguous area:

DIRBASE ->	DIRECTORY BITMAP	The bitmap defines the available/used sectors in the directory. If the directory is <= 6112 sectors, then the bitmap will occupy 3 sectors. If the directory size is > 6112 sectors, then the bitmap will occupy 32 sectors with DIRBASE pointing to the 30th sector of the bitmap. A zero bit in the bitmap represents a used sector. Words 0 and 1 of the bitmap are ignored.
DIRBASE+3 ->	DIRECTORY DATA	Directory entries contain pointers which are sector displacements relative to DIRBASE. Entries and indices are grouped into "blocks".
	Entries and Indices	

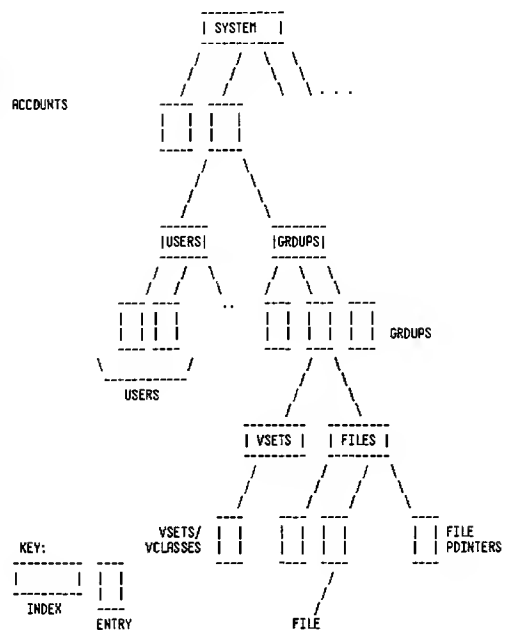

The capacities for accounts/groups/users/files are dependent on their block sizes.

* SYSSRIBSIZE	System acct index block size (3 sectors)
* SYSRUIBSIZE	Acct. user index block size (1-3 sectors)
* SYSRGIBSIZE	Acct. group index block size (1-3 sectors)
* SYSGFIBSIZE	Group file index block size (2 sectors)
* SYSGVSIBSIZE	Group volume set definition ind. blk. size(1 sector)
* SYSRAEBSIZE	Acct. entry block size (3 sectors)
* SYSUEBSIZE	User entry block size (2 sectors)
* SYSGEBSIZE	Group entry block size (2 sectors)
* SYSFEBSIZE	File entry block size (2 sectors)
* SYSVSEBSIZE	Volume set definition entry block size (1 sector)
* SYSMBXBSIZE	Maximum of above. (used to initialize DOS.)

*These values are used once for the creation of the (root) system, account index or new systems. This root index is always at address DIRBASE+3.

Directory

This section of the bit map DST is occupied by up to 3 sectors of bit map. It is swapped in 3 sectors at a time as needed. DS'FIRST'WORD is updated to search for space in the bit map. When it reaches DS'LAST'WORD for the second pass, the next 3 sectors of bit map will be swapped in.

Partial definitions:

DS'LDEV = DS'BASE.(0:8)
 DS'DIRTY = DS'FLAGS.(0:1)
 DS'ERR'IN'PROG = DS'FLAGS.(1:1)
 DS'DIR'DISABLED = DS'FLAGS.(2:1)
 DS'PERM'DISABLE = DS'FLAGS.(3:1)

Descriptions:

DS'ADDR

This is the address of the section of bit map that is currently in the buffers. For example, this address will usually be the same as DS'BASE. If we need to page in more sectors of bit map than the first three, then this address will be subsequently larger than DS'BASE.

DS'BASE

This is the base address of the directory bit map. If the directory is greater than 6112 sectors, then this address will be 29 sectors less than the address found in the Cold Load Information table on disc.

DS'CUR'SECTOR

This is the current bit map sector number of the first sector in the buffer area. Its value can range from 1 to 30. This number minus one added to DS'BASE will result in DS'ADDR.

DS'DIR'DISABLED

If this bit is on, the directory allocation and deallocation is off and only a WARNSTART will turn this bit off. The bit is turned on if an I/D error occurs on a directory bit map sector or if we find data integrity problems with the bit map, i.e. if we attempt to deallocate a sector that is already deallocated.

G.00.00
4- 7

Directory

DS'DIR'SIZE

This is the size (sectors) of the directory area. This size includes only the last 3 sectors of the bit map. If the directory is greater than 6112 sectors, then this size does not include the extra 29 sectors of bit map. It can also be thought of as the number of bits in the bit map.

DS'DIRTY

This bit is set if the bit map sectors in the buffer have been modified in any way. When more sectors must be brought into the buffers, or if we switch to a different domain (system to PV, PV to system) this bit is interrogated to determine if the sectors presently in the buffers must be first written to disc.

DS'ERROR'LDEV

The LDEV in which the last directory error occurred.

DS'ERROR'TYPE

This word describes the type of directory bit map error that occurred. Its legal values are:

- 0 - No error
- 1 - I/D error on a write
- 2 - I/D error on a read
- 3 - Attempting to deallocate space that is already deallocated
- 4 - Directory space management is already disabled

DS'ERR'IN'PROGRESS

R directory space management error is currently in progress.

DS'FIRST'WORD

R DST relative pointer to the word in the bit map buffer that we will interrogate next when directory space is needed. When the system first comes up, this word is always initialized to DS'HEADER+2 (i.e. to point to the first word in the bit map). On subsequent bit map sector reads, it is set to DS'HEADER since subsequent sectors will not have the 2 word overhead that exists in the first sector of the bit map.

DS'FLAGS

This word contains numerous flags. See individual descriptions.

DS'LAST'SECTOR

This is the total number of active bit map sectors. This number will range from 1 to 32.

G.00.00
4- 8

DS'LAST'WORD

This is the current number of bit map word in the buffer. It can range from 1 to $2577 + \text{DS'HEADER}$. If there exists 3 full sectors in the buffer, then it will have the value $2600 + \text{DS'HEADER} - 1$ or 2621 . It is compared to DS'LAST'WORD to determine if we have hit the end of the current buffer area.

DS'PERM'DISABLE

If this bit is set, then directory allocation/deallocating is permanently disabled. This bit should not be set.

DS'REQ'SECTOR

This is the next sector to begin reading in up to 3 bit map sectors. It is updated by 2 or 3 and the read procedure will bring in up to 3 sectors starting from this sector. If this sector is set to be greater than DS'LAST'SECTOR, then it is reset to 1. After the sectors are read in, DS'CUR'SECTOR is set the DS'REQ'SECTOR.

DS'SIZE

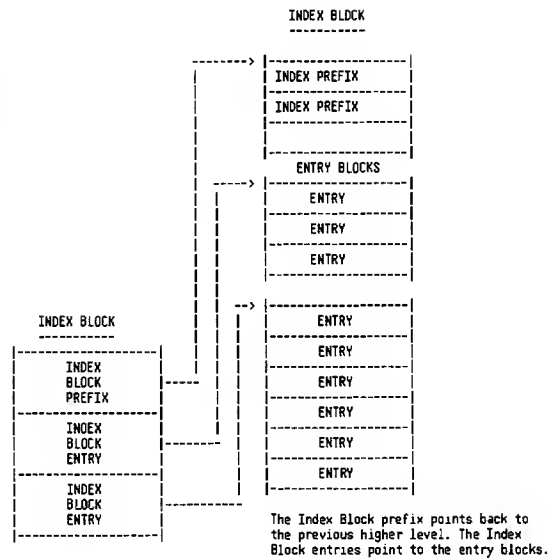

This is the size in words of the bit map buffer area. It is always a multiple of a sector (128 words). It will usually have the value of 2600. Legal values are 2200, 2400 and 2600.

DS'SYS'LAST, DS'SYS'FIRST, DS'SYS'CUR & DS'SYS'SIZE

The values of DS'LAST'WORD, DS'FIRST'WORD, DS'CUR'SECTOR and DS'SIZE will be stored in these locations when the directory space management switches from the system directory to a private volume directory. And, of course, when DSM switches back to system domain, the above mentioned values are reinitialized with these values.

0															1	(no impeded processes)
0															2	
0															3	
PCB index of holder															0	SIR locked
SIR QUEUE LENGTH															1	(impeded processes)
HEAD OF IMPEDED LIST(PCB relative)															2	
TAIL OF IMPEDED LIST(PCB relative)															3	

The SIR table is indexed by SIR#, with each SIR# corresponding to a unique, pre-assigned system internal resource. Entry #0 is not used. Impeded lists are established by using the SIR table entry (2) as the head of the list and PCB(15) for elements. PINs are always used as pointers, with 0 indicating end of list.

CHAPTER 6 FILE SYSTEM

This chapter describes the MPE V file system. The second section describes the basic concepts. The third section describes the table structures used.

File System Overview

I/O to files is done by reference to file numbers, which are assigned by calling the FOPEN intrinsic. This establishes an initial "point of attachment", which may be described as a connection between a program (i.e., process) and that particular point in a particular file at which the next FREAD or FWRITE would cause data to be transferred. A point of attachment is described by a control block, of which there are several different kinds (described later). Control blocks may exist in the process's own stack or in an extra data segment assigned by the file system. In order to find control blocks quickly, a pointer scheme called vectors is used. A control block is uniquely described by a vector, which consists of two words with the first word containing a segment number and the second word containing a word offset into the control table of the vector table entry which describes the location of the control block within that segment. The entire assemblage, consisting of eight overhead words, the vector table, and all of the control blocks to which it points, comprises the entire segment; if in a stack, it occupies part of the PXFILE part of the PCBK.

The point of attachment is described by a "physical access control block", or PCB, which will exist as a result of an FOPEN to any file (except \$NULL). Any required I/O buffers are associated with the PCB; refer to Section 2.1.

All FOPENs specifying "multi-access" for all processes running under a single job use a single PCB for references to a multi-access file. Although all these are attached to a single point in the file, the type of attachment (i.e., ROPTIONS) may be different. So, each FOPEN specifying a multi-access file establishes a "logical access control block", or LACB, which contains the point-of-attachment local values. The use of a single buffer (i.e., PCB) ensures that references by various processes or against various FOPENs within one process are dealt with in strict sequential order. Note that references to a file by other jobs, or by other processes not specifying multi-access, will be through other PCBs, whose buffers will be read or written at the pleasure of the file system; in order to ensure any sort of coherence to such shared references, the jobs must use global RIMS and FLOCK and FUNLOCK the file. \$STDIN, \$STDLIST, and spoolfiles are opened multi-access automatically.

In the case of disc files, there is another kind of control block: the file control block (FCB). It contains copies of information read from the file label, such as the end-of-file pointer, the extent map, and the record and block structure. The EOF pointer is updated in the FCB as the file is written, and all changes made to the FCB are posted to the file label when the file is closed. An FCB is shared by all jobs in the system which reference the file.

G.00.00
6- 1

The file number assigned by an FOPEN is an index into the Available File Table (AFT), a table of six-word entries which is at the end of the PXFILE part of the PCBK. Two double words are vectors to the PCB and (if it exists) the LACB.

AFT entries can also reside in a global AFT extra data segment. If the file was opened Global AFT (specified in the ROPTIONS) and the program is privileged, then the AFT is placed into this global AFT OST. Any accesses to the file are identical to local AFT's. All accesses to the file opened global must be done from privilege mode code. The file system intrinsics distinguish this file by a negative file number. Again, these files are identical in every other way except for where the AFT entry resides.

Because control blocks are shared among processes, it is necessary to have a scheme for coordinating access to them. A control block is "locked" by a process which requires exclusive access to it for a time. Other processes which attempt to lock the block will find it already locked, and will be in-peded and queued. It may also be necessary to lock an entire control block table so that a process can create or destroy a control block in it, or lock or unlock an existing control block in the table.

Another table used by FOPEN is the File Multi-Access Vector Table (FMAVT). This table exists in a system extra data segment and is used by all jobs and processes in the system. When a file is being FOPENed with multi-access specified, the FMAVT is searched; if the file is already open, the FMAVT gives the PCB vector for the prior reference for each job.

Buffers

A bit in ROPTIONS specifies, when a file is opened, whether access is to be buffered or unbuffered. If unbuffered, data is transferred directly between the I/O device and the user's buffer (usually in his stack), which will be frozen in memory for the duration of the transfer. If buffered, the data is moved between the user's buffer and a file system buffer to which the I/O is actually done.

Buffers are associated with the PCB, attached to it as an appendage.

G.00.00
6- 2

Table Formats

This section gives a detailed discussion of the main tables constructed and used by the file system. The location and overall structure of each table is given, in addition to the table format and a discussion of each field in the table. Table indices at the right of the table are in octal. Index names apply to the entire word; if in parentheses, the names are defined in the file system listing but not explicitly used there.

File System Section of PCBK (PXFILE)

The PXFILE area is a subsection of the PCBK. It is a contiguous, expandable and contractible block of storage that is managed by the file system primarily for its own use. Other subsystems, namely CS and DS, also make use of the PXFILE section. In doing so they must conform to the conventions of the file system.

The overall structure of the PXFILE area is:

OVERHEAD	(FIXED)
CONTROL BLOCK TABLE	(VARIABLE)
AVAILABLE	(VARIABLE)
ACTIVE FILE TABLE	(VARIABLE)
	DL-5

G.00.00
6- 3

Overhead

The part labeled Overhead contains information that pertains to the entire section. It is addressed via the pointer at DL-3.

0	1	7	8	15		
PXFILE SIZE IN WORDS					0	PXFSIZE
LAST OPEN ERROR NO. LAST OPEN ERROR NO.					1	
N					2	
LAST DE AFT					3	
SLAVE AFT NUMBER					4	
LAST KOPEN ERROR NUMBER LAST FOPEN ERROR NUMBER					5	
AFT SIZE IN WORDS					6	PXAFTSIZE
CS TRACE FILE INFO					7	(PXCTRINFO)

1ST USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					9	PXLEFTOFF
2ND USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					10	PXFCBT1
3RD USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					11	(PXFCBT2)
4TH USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					12	(PXFCBT3)
5TH USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					13	(PXFCBT4)
6TH USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					14	(PXFCBT5)
7TH USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					15	(PXFCBT6)
8TH USER (NOBUF) CONTROL BLOCK TABLE OST NUMBER					16	(PXFCBT7)
					17	(PXFCBT8)

Partial word field identifiers are:

PXFDOPEN = PXFILE(1).(0:8)%, last OPEN error code
 PXFCOPEN = PXFILE(1).(8:8)%, last OPEN error code
 PXFNOCB = PXFILE(2).(0:1)%, no CB's in PXFILE CBT?
 PXFKOPEN = PXFILE(5).(0:8)%, last KOPEN error code
 PXFFOPEN = PXFILE(5).(8:8)%, last FOPEN error code

G.00.00
6- 4

Discussion:

PXFAFTSIZE	This is the size (in words) of the Active File Table (AFT). The size is in words to simplify calculating the size of the available block.
PXFCBT1-8	These are the DST numbers of the user (NDBUF) control block tables. A DST number of 0 indicates that no data segment is allocated.
PXFCOPEN	This contains the last COPEN error number. Not used by the file system.
PXFCINFO	This contains information pertinent to the CS trace file. Not used by the file system.
PXFDOPEN	This contains the last DOPEN error number. Not used by the file system.
PXFDINFO	Reserved for DS. Not used by the File system.
PXFFDOPEN	This contains the last FOPEN error number. If it is zero then the last FOPEN successfully completed; otherwise the last FOPEN was unsuccessful and the number is the file system error number.
PXFKDOPEN	This contains the last KOPEN error number. XSAM is partly embedded in the file system, and an FOPEN failure on a XSAM file can be caused by a failure to open either the key file or the data file. This error number is used in conjunction with PXFFDOPEN to determine which file caused the XSAM open failure. This error number is not used by the file system.
PXLEFTOFF	This is the AFT entry number of the last file/line that completed a nowait I/O; if zero then no nowait I/O has been completed. This cell is maintained solely by and for the IDWAIT intrinsic.
PXFNCB	This bit signifies that control blocks are not to be created in the PXFILE control block table. This bit is set by the MDCB parameter to the CREATE intrinsic or the :RUN command. This feature permits the user to have as much stack space as possible; otherwise the file system will take several hundred words of stack for the PXFILE control block table.
PXFSIZE	This is the size (in words) of the complete PXFILE area. It is the sum of the overhead block, the control block table, the active file table and the available block.

G.00.00
6- 5

PXFILE Control Block Table (PXFCBT)

Addressing within a PXFILE control block table is somewhat more complicated than addressing an extra data segment CBT since the table does not begin at DB+0. As a result all pointers within the table are table relative; the starting address of the table must be added to a pointer to generate a final DB-relative address. This addressing convention is consistently applied to all control block tables.

When the control block table is expanded, space is taken from the AVAILABLE area. If no space is available then the PXFILE area is expanded and the acquired space is added to the AVAILABLE area.

Available Block

The part labeled Available is used to provide space when the Control Block Table or the Active File Table is expanded. These two tables grow towards each other, and when more space is needed it is simply taken from the Available Block.

When the Available area is exhausted, the PXFILE area is expanded, the AFT is relocated and the new space is added to the Available Block.

Currently the PXFILE area is only expanded; it is never contracted.

G.00.00
6- 6

Active File Table (AFT)

The part labeled Active File Table contains information used by the file system (or CS, DS, etc.) to grossly characterize the file access and, most importantly, to give the location of the control blocks.

The overall structure of the AFT is:

ENTRY N	(FIXED, 6 WORDS)
...	
ENTRY 1	DL-9 (FIXED) DL-5

where N = PXFAFTSIZE/6.

The length of the AFT is specified by PXFAFTSIZE. Unused entries are all zeros. When the table is full it is expanded by taking space from the Available block.

The AFT is negatively indexed by file number: the entry at DL-9 corresponds to file number 1, the entry at DL-15 corresponds to file number 2, etc.

The structure of the global AFT DST, described in Section 2 is as follows:

ENTRY D, NOT USED	DB + D
ENTRY 1	DB + 6
ENTRY N	DB+(N*6)

G.00.00
6- 7

The structure of a file system AFT entry is:

0	1	2	3	4	5	15
ENTRY TYPE	1	N	1			
PHYSICAL ACB DST NUMBER						0
PHYSICAL ACB ENTRY ADDRESS						1 AFTPCBDST
LOGICAL ACB DST NUMBER						2 AFTPCBENTRY
LOGICAL ACB ENTRY ADDRESS						3 AFTLACBOST
NO-WAIT I/O IDQX						4 AFTLACBENTRY
						5 AFTIDQX

The entry format depends on the entry type; the File system uses entry type 0.

The following partial word field identifiers are used:

AFTTYPE	= AFT.(D:4)N,	entry type
AFTNULL	= AFT.(4:1)N,	\$NULL file

Discussion:

AFTIDQX

This is the IDQ index of the pending nowait I/O (if any). This is applicable if the file was opened with the NOWAIT option specified. Also, CS and DS have the same capability and use this cell in a consistent manner. This is because the IDWAIT intrinsic services the file system as well as CS and DS, and is the principal user of this cell. If the IDQX is negative, then one of two possibilities exist. If the file is a message file, then file IDQX is the accessor's reply port. If the file is a standard MPE file, then a read was done to a nonexistent extent and this is simply a stub inserted by the file system.

AFTLACBOST

This is the DST that the Logical ACB (LACB) if it exists. This is applicable if the file was opened with the multi-access option specified.

AFTLACBENTRY

This is the word offset into the control block table of the LACB vector table entry, applicable if the file was opened with the multi-access option specified.

AFTNULL

This bit signifies that the file is \$NULL and that there are no control blocks.

G.00.00
6- 8

File System

AFTPRCBST This is the DST that contains the Physical ACB (PRCB). A PRCB exists for all files except \$NULL.

AFTPRCBENTRY This is the word offset into the control block table of the PRCB vector table entry. This will be nonzero for all files except \$NULL.

AFTTYPE This is the AFT entry type number. At present the following entry types are defined:

- 0 - file system
- 1 - remote file
- 2 - OS (nowait I/O disallowed)
- 3 - OS (nowait I/O allowed)
- 4 - CS
- 5 - CS
- 6 - KSRM
- 8 - Message File

Remote file AFT entry:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---
FSTYPE																0

LINE NUMBER																1

REMOTE FILE NUMBER																2

PENDING FCLOSE DISPOSITION FROM FOPEN																3

UNUSED																4

IOQX																5

AFT 0 FSTYPE - This value will be 1 for remote files.
MR - Set if the file was opened multi-access.

AFT 1 - Local line number of remote file.

AFT 2 - File number of the remote file.

AFT 3 - Pending disposition of the file. Set when file was FOPEN'd and will possibly be used as the FCLOSE disposition.

AFT 5 - No wait I/O Queue Index.

G.00.00
6- 9

File System

OS AFT entry:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---
FSTYPE	C	M	P	I	R											0

DATA SEGMENT NUMBER																1

OSDCB INDEX																2

LDEV NUMBER																3

PREVIOUS AFT POINTER																4

IOQX																5

AFT 0 FSTYPE - This field will have the value 2 or 3.
C - On if DSCOPEN called by CXDSLIN or REMOTE'HELLO.
M - On if Master PTOF AFT.
P - On if PTOF related.
R - On if remote main process.

AFT 1 - DS data segment table pointer.

AFT 2 - OSDSCB Index - DS data segment control block index.

AFT 3 - Logical device number.

AFT 4 - Preceding DS open AFT Pointer.

AFT 5 - IOQX - Same as described above.

G.00.00
6- 10

File System

CS Line entry:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---
FTYPE	U	W	I	D	B											0

LOGICAL DEVICE NUMBER																1

VECTOR TO MULTIPLE IOQ INDICES																2

TR	I	I	R	I	DIAL											3

MISC'DST																4

IOQX (CID only)																5

AFT 0 FTYPE - This value will be 4 or 5. A 5 signifies that the line has an autodialer attached.
W - The line has been opened with no waiting on I/O requests.
ID - Line is a multipoint control or 3270 station.
B - Line was opened with buffering.

AFT 1 - Logical device number of the line.

AFT 2 - Vector to Multiple IOQ indices.

AFT 3 TR - Bit 0 on signifies tracing enabled. Bit 1 on signifies trace all.
I - On if line is currently connected.
R - Signifies that this CS device is an SCCP device.
DIAL - 0 = Dial on write, answer on read.
1 = Answer on write, dial on read.
2 = Always dial.
3 = Never dial.

AFT 4 - DST number of the line's misc data segment.

AFT 5 - If <> 0, then it is the system DB address of a single request IOQ entry. IOQWAIT uses this word to pass the IOQ index of the completed request for this AFT to CSIOQWAIT.

G.00.00

File System

File Control Block Table (CBTAB)

A file control block table can be located in two places: (a) as a subpart of the PXFILE area, as discussed in Section 3.1.2; or (b) in a data segment. Although putting control block tables in PXFILE has the advantage of providing rapid access, it detracts from the space for the user's stack; so the larger control blocks (or optionally, all control blocks) are put into extra data segments. On the other hand, referencing extra data segments may result in an absence trap, which is slow. Extra data segment control block tables are of three kinds: expandable, nonexpandable, and shared FCB. Nonexpandable CBT's are used for a single PRCB with buffers, i.e., where the control block is large or where the control block can't be local to a single process (for multi-access). Expandable (or NOBUF) CBT's are used for small control blocks, as LACB's, PRCB's with no buffers, and FCB's which are local to a single process. A list of the expandable CBT's associated with a process is kept in the overhead area of PXFILE (cf. Section 3.1.1). When a small control block is needed, these CBT's are checked in order to see if one of them has room. Shared FCB CBT's are similar to expandable CBT's except that they belong to the system rather than to a single process; the system keeps a list of DST's which it has assigned for this purpose.

The overall structure of a control block table is:

OVERHEAD	(FIXED, 8 WORDS)
VECTOR TABLE	(VARIABLE)
CONTROL BLOCK AREA	(VARIABLE)

G.00.00
6- 12

Overhead

The part labeled Overhead contains information pertaining to the entire table.

0	1	2	6	7	15
TABLE SIZE IN WORDS					
DST NUMBER CONTAINING TABLE					
TYPE VECTOR TABLE SIZE IN WORDS					
LOCK PIN					
L					
IMPEDED QUEUE HEAD					
IMPEDED QUEUE TAIL					
UNUSED					

Other identifiers used:

CBTTYPE = CBTAB(2).(0:2) Control block table type
 CBTVSIZ = CBTAB(2).(2:14) Vector table size
 CBTLOCKBIT = CBTCONTRL.(0:1) Lock bit

Discussion:

CBTOSTX This is the DST number of the data segment that contains the control block table. If the table is contained in a stack, i.e. in the PXFILE area, then this is the DST number of the stack and not 0.

CBTLOCKBIT If the entire control block table is locked, then this bit is set. No locking count is kept since control blocks are locked only once from FCREATECB and FDELETECB when control blocks are added to and deleted from the table. The procedure LOCK*CB does not lock the control block because it runs PSEUDOISABLED during the critical times.

CBTQUEUE This is the impeded queue for the table and has the same format as the impeded queue for a control block in the table. There is no second impeded queue because that facility is used exclusively for BREAK requests against the PCB for \$STDIN/\$STDLIST.

G.00.00
6-13

CBTPIN This is the PIN number of the process that has the control block locked.

CBTSIZE This is the size in words of the table. It is initialized when the table is created and changed when the table is expanded. It present a table is never contracted, even though this is possible.

CBTTYPE This field is the type of the control block table. Possible values are:
 0 - stack [PXFILE]
 1 - Mdbuf (expandable)
 2 - System shared PCB
 3 - Buffered (Contains a single PRCB)

CBTVSIZE This is the size, in words, of the vector table area in the control block table. It does not reflect the number of entries used or unused.

NOTE: All PIN's are kept as the word offset into the PCB table and as the actual PIN number.

G.00.00
6-14

Vector Table

The part labeled Vector Table contains information used to locate and lock or unlock control blocks in the control block table.

The overall structure of the vector table is:

ENTRY 0	(FIXED, 8 WORDS)
.	
.	
ENTRY N	(FIXED)

where $N = (CBTVSIZE/8) - 1$.

An unused vector table entry will have zeros in all the words of the entry. A used vector table entry will have a nonzero value in the first word of the entry (the control block address is necessarily nonzero).

The general structure of a vector table entry is:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
CONTROL BLOCK ADDRESS															
L B COUNT UNUSED															
LOCK PIN															
HIGH PRIORITY HEAD PIN															
HIGH PRIORITY TAIL PIN															
LOW PRIORITY HEAD PIN															
LOW PRIORITY TAIL PIN															
UNUSED															

G.00.00
6-15

The following partial word identifiers are used:

VT'LOCK'BIT = VT'CONTRL.(0:1)
 VT'BREAK'BIT = VT'CONTRL.(1:1)
 VT'COUNT = VT'CONTRL.(2:6)

Discussion:

VT'ADR Control block address is the table relative address of the control block associated with the vector table entry. It is a word displacement from the beginning of the control block table.

VT'BREAK'BIT This bit signifies that we are in the middle of break mode. This is used for the PRCB of \$STDIN/\$STDLIST from a terminal session only.

VT'LOCK'BIT This bit is set whenever the control block is locked.

VT'COUNT This is the count of the number of times that the control block has been locked by the process identified in VT'PIN. If it is zero, then the control block is not locked.

VT'PIN Contains the PIN of the process which has exclusive access to the control block. Other processes attempting to access the block will be impeded and queued.

VT'QUEUE The high priority impeded queue is a double word of PINs that are the head and tail of the impeded queue of processes waiting for access to the control block. Processes are impeded and unimpeded by the file system using the normal mechanisms available under MPE.

VT'SAVEDQUEUE The low priority impeded queue is a double word of PINs and has the same format as VT'QUEUE. The only time this word is used is when the control block is in BREAK mode, which can only happen to an RCB corresponding to \$STDIN/\$STDLIST. It is used to save the current VT'QUEUE when the control block goes into BREAK mode and to restore VT'QUEUE when the control block goes back into non-BREAK mode.

NOTE: All PIN's are stored as offsets within the PCB table and not as actual PIN numbers.

G.00.00
6-16

Control Block Area

The part labeled CONTROL BLOCK AREA contains the control blocks used by the file system.

To facilitate storage management, all control blocks have the same overall structure:

where N = Size-1.

Partial word field identifiers are:

CBTYPE = CB.(0:2)#, control block type number.
CBSIZE = CB.(2:14)#, control block size

Discussion:

CBDESCRIP This is the first word of a control block; the format is common for all control blocks.

CBSIZE This is the size (in words) of the control block. The size includes the descriptor word.

CBTYPE This is the type number of the control block. There are four types of control blocks:

0 - Garbage 1 - FCB 2 - PACB 3 - LACB

When a control block table is created the initial control block area is completely allocated to a single control block of type garbage. When space is requested for a new control block the control block area is scanned (using a first fit algorithm) for a garbage control block that is as large as the size requested. The space for the new control block is taken from this garbage control block and the space remaining becomes the new garbage control block size.

G.00.00
6- 17

When space is returned it becomes a new garbage control block. To reduce fragmentation the new garbage control block is combined with either of the two neighboring control blocks if they are of type garbage.

If space is requested and no garbage control block is large enough to contain the new control block then the control block area and control block table are expanded by a sufficient amount. If expansion is not possible, some other control block table must be used.

Access Control Block (ACB)

Virtually every file system intrinsic constructs an ACB as its first action. When using the multi-access option, each accessor shares a single PACB. However each accessor is permitted to view the shared file in a slightly different manner than the other accessors. For example, one accessor may access the file in a read-only mode while the other accessors may access the file in a read-write mode. To do this, each accessor must, during his access, have a slightly different ACB.

The PACB holds information that is global to all accessors of the file. The LACB holds information that is local to each accessor of the file. At the beginning of a particular access, an ACB is constructed by calling LOC'ACB, which copies information from both the LACB and the PACB. At the end of the access, the ACB is released by calling UNLOC'ACB; this updates the PACB and LACB from the ACB since some of the fields may have been modified due to the access. This scheme nearly eliminates EXCHANGE'ACB's to access the various data segments.

G.00.00
6- 18

Logical Access Control Block (LACB)

All LACBs have the same structure:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

The buffering extension is optional; it is present if and only if the file is accessed with buffering. There are thus two possible formats for an ACB:

1. No buffers; the buffering extension is not present.
2. PACB buffers; the buffering extension is present and the buffers are in the buffering extension.

If multiple PCB buffers exist, there will be a buffering extension for each, immediately preceding the buffer. The basic PCB (or NDBUF PCB) is copied into the the RCB as words 0 through X63; an RCB "extension" is then generated in words X64 - X67. The resulting ACB thus has the following format:

G.00.00
6- 21

G.00.00
6- 22

32	FCB VECTOR		33
27			
28	TOTAL NUMBER OF LACB'S		34

49			61
50	UNUSED		62
51	UNUSED		63

The above words, 0-X63, are physically located in the PACB of the file. Below, words X64-X67, are used by file system intrinsics- and are placed onto the stack by the procedure LOC'ACB when locking the ACB. Therefore, the buffering extension, if pres-ent, will immediately follow word X63 of the actual ACB in the Control Block Table of the file.

52	DST RELATIVE OFFSET TO PACB	64
53	DST RELATIVE OFFSET TO LACB	65
54	DST RELATIVE OFFSET TO ACB IN THE STACK	66
55	STACK RELATIVE OFFSET TO DB	67

The following identifiers are used when referring to an RCB:

(RCBSIZE)	=	ACB.(2:14)W;	size in words
ACBNUM	=	ACB(1).(8:8)W;	file number
RCBNAME	=	RCB(2)W;	file name

 ACBP1P2 = ACB(48)%, Used by FDEVICECONTROL
 ACBP1 = ACB(49)%,
 ACBP2 = ACB(49)%,

Discussion:

ACBBOATREAD This flag is used to abort a broken terminal re-read. The flag is set via the ABORT parameter to FUNBREAK. If the flag is set then the READ PENDING message will be aborted along with the re-read. This feature is needed to handle the BREAK...ABORT, etc. situation.

ACBACCL This is the access class part of the device type number. The following are legal values:

- 0 - direct (e.g. disc)
- 1 - serial input (e.g. card reader)
- 2 - parallel input/output (e.g. terminal)
- 3 - serial input/output (e.g. magnetic tape)
- 4 - serial output (e.g. line printer)

ACBACCESS This is the access bit map for the file. The following are the bit definitions of this eight-bit field:

- (0:1) - unused
- (1:1) - unused
- (2:1) - read
- (3:1) - append
- (4:1) - write
- (5:1) - lock
- (6:1) - execute
- (7:1) - save

This access security is determined by the ACCNECK intrinsic and enforced by the file system.

ACBROPTIONS This is the AROPTIONS in effect for this file access.

ACBBINARYIO This bit controls full eight bit transfers on the 2644 page mode terminal. It is adjusted by FCONTROL(26) and FCONTROL(27).

ACBBLK This is the block number of the current variable record format block. Applicable if the record format is variable.

ACBBLKFACT This is the blocking factor for the file. It is the number of records in a block. Legal values range from 1 to 255.

G.00.00
6- 26

File System

ACBBREAK This is the break mode flag. It is applicable if the ACB is for \$STDIN or \$STOLIST. If set it means that the BREAK key has been hit and that the CI should have high priority access to the ACB. The flag will be cleared when a RESUME or ABORT is issued.

ACBBSIZE This is the block size, in words, of the file.

ACBTRFCT This is the total number of blocks transferred to and from the file. The initial value is 00.

ACBUBUFUSED This is the word index, relative to the base of the block, for the selected record within the block. This is applicable if the file access is buffered.

ACBCARRIAGE This bit signifies that the file has carriage control. It is the same as the carriage control bit in ACBFOPTIONS if the file is spooled. If not spooled, the bit is zero, and IOMOVE will pass the FWRITE carriage control parameter directly to the driver rather than embedding it as the first character of the output record.

ACBCTL This is the CONTROL parameter from the last FWRITE. This value is pertinent if the file was opened with carriage control.

ACBUBABUF This is the buffer number (0-relative) containing the most recently referenced record. Applicable if the file access is buffered.

ACBQDDA This is the logical device number of the file. For a disc file this is the logical device number of the first extent.

ACBQDFBLCK This bit signifies that the file is to be accessed with default blocking. The bit is initialized from the FOPEN stateword STATE. It does not need to be in the ACB; it is mentioned here only to signify that the bit is effectively used due to the way ACBSTATE is initialized from STATE.

ACBQISP This is the file close disposition derived from the FOPEN call. The only way this can be specified is via a file equation. The legal values are the same as those for FCLOSE. ACBQISP This is the file reference format type number and is derived from the FOPEN call. The following are legal values:

- 0 - full name
- 1 - account name absent
- 2 - group and account name absent
- 3 - null name

This information is needed by FRENAME.

G.00.00
6- 27

File System

ACBDTYPE This is the device type number of the file. The following are legal values (octal):

- 0 - moving head disc
- 1 - fixed head disc
- 7 - foreign disc
- 10 - card reader
- 11 - paper tape reader
- 20 - terminal
- 24 - card reader/interpreter/punch
- 26 - SSLC
- 27 - programmable controller
- 30 - magnetic tape

- 44 - CALCOMP 600 plotter
- 45 - CALCOMP 700 plotter

ACBEOF This bit is set when EOF has been sensed.

ACBEOFs This is the type of EOF detected on \$STDIN(K). This field consists of two bits:

- (0:1) - super colon (i.e. EOF for \$STOINX)
- (1:1) - regular colon (i.e. EOF for \$STOIN)

Applicable for multi-access to \$STDIN(K) only.

ACBERROR This is the error number for the file. It is used by all intrinsics except FOPEN. When an error is detected the error number is placed in this cell. The error number is cleared at the beginning of each callable intrinsic except FCHECK (which reads it).

ACBFCB This is the FCB vector for the file. Applicable only to disc files.

ACBKEYS This bit controls the definition of the f1 and f2 function keys on the 2644 page mode terminal; it is adjusted by FCONTROL(32) and FCONTROL(33). (Obsolete function)

ACBFNUM File number, range from 1 to 255. Used mostly for calling routines that access things such as labels by file number.

ACBFOPTIONS This is the FORTIONS in effect for this file access.

ACBFPTR This is the sequential access record pointer; it contains the next sequential record number. The initial value is 00. This value is used only by the FREAD, FWRITE and FUPDATE intrinsics. However the value is

G.00.00
6- 28

File System

	maintained by all data transferring file system intrinsics.
ACBFMAVTX	This is the entry index into the file multi-access vector table (FMAVT). This is valid if the file access is multi-access.
ACBGSTATE	These are miscellaneous state flags. These are "global" in nature in that they are the same for all accessors in a multi-access environment. The constituent bits are described individually.
ACBGSTATUS	This is the general part of the last I/O status for the file. The following are the legal values: 0 - pending 1 - successful 2 - end of file 3 - unusual condition 4 - irrecoverable error
ACBHBLK	This is the highest block number for which an anticipatory read has been issued, and is applicable if the file access is buffered. The initial value is -10.
ACBHIT	This is the buffer hit flag. If set it indicates that the last read or write request was serviced without any physical I/O required. This flag is used only for performance measurement. The code which manipulates it is optional to the file system, and is controlled by compiler toggle M3.
ACBINHIBCALF	This bit controls the termination of lines written to the terminal. If not set then each line is terminated with a CR and LF; if set then no line termination characters are used. This bit is valid if the file is a terminal file; it is adjusted by FSETMODE.
ACBLINCTL	This is the line control bit. If not set then each line is post-spaced; if set then each line is pre-spaced. This bit is used by line printers and terminals only. It is adjusted by FCONTROL(1) and FWRITE with the appropriate carriage control.
ACBLPCTL	This are the line and page control bits, which are described separately.
ACBLSTATE	These are miscellaneous state flags. They are "local" in nature in that they may be different for each accessor in a multi-access environment. Bits (9:6) are initialized from the stateword local variable called STATE in FOPEN; the ten remaining bits are initialized individually. The constituent bits are described individually.

G.00.00
6- 29

File System

ACBMODE	These are miscellaneous mode flags. The constituent bits are described individually.
ACBNAME	This is the local file name. The name is eight bytes in length with trailing blanks added.
ACBNEWEOF	This flag when set indicates that a new tape mark should be written before the tape is rewound or backspaced. Applicable only to magnetic tape files.
ACBNEWITEOF	This bit is used to save the value of the local EOF advanced flag NEWEOF in IOMOVE between the I/O initiation and I/O completion calls. This flag is applicable if the file is accessed in nowait I/O mode.
ACBNOWAITMODE	This cell is used to save the I/O mode between nowait I/O initiation and completion calls. If the bit is set then the last I/O request was a write; otherwise it was a read. This cell is pertinent if the file is accessed in nowait I/O mode.
ACBNUMBUFS	This is the number of buffers, less one, used for the file access. Applicable if the file access is buffered.
ACBPAGECTL	This is the page control bit. If not set then a page is assumed to consist of 60 lines (auto page eject); if set then a page is assumed to consist of 66 lines (no auto page eject). This is used primarily for line printers but is also valid for terminals; these are the only devices for which this is valid. This bit is adjusted by FCONTROL(1) and FWRITE with the appropriate carriage control.
ACBPRIV	This flag when set indicates that the file is privileged in that it has a negative file code; the user must be in privileged mode to access it.
ACBQSTATUS	This is the qualifying part of the last I/O status for the file. The values are unique for each general status part. See I/O System INS for all legal values.
ACBQUIESCE	This bit controls critical output verification. If set, buffered output is guaranteed to have been written to the device when control is returned to the user. This bit is adjusted by FSETMODE.
ACBREACODE	This field consists of the input EOF checking type and mode, and is used to generate the P1 parameter to ATTACHIO. These fields are described individually.
ACBREAMODE	This field controls the input EOF checking mode. It is 00 for reading \$STOIM, 01 for reading \$STOIMX, and 10 for the command interpreter.

G.00.00
6- 30

File System

ACBREAROTYPE	This field controls the input EOF checking type. It is 01 for JOBS, 10 for SESSIONS, and 00 for DATA.
ACBASIZE	This is the file's record size in positive bytes.
ACBATFACT	This is the total number of records transferred to and from the file. The initial value is 00.
ACBSAVEEOFS	This field is used to save the contents of ACBEOFS during BREAK node processing.
ACBSHCNT	This is the total number of LACBs that exist for this PACB. Valid if the file access is multi-access.
ACBSHCNTIN	This is the total number of input-only LACBs that exist for this PACB. Valid if the file access is multi-access.
ACBSHCNTS	This is the total LACB and total input-only LACB counts, each of which is described separately.
ACBSIZE	This is the size, in words, of the ACB. The complete size (including buffers) may be calculated from the DST size containing the ABC. It does not include the buffering extension, if present.
ACBSPROPT	This is the FOPTIONS for the spooled device. Applicable if the file access is to a spooled device.
ACBSPFOP	This is the FOPTIONS for the spooled device. Applicable if the file access is to a spooled device.
ACBSPOOLEO	This is the spooled device flag. If set then the file access is to a spooled device.
ACBSPOOLIO	This field is a combination of the spooled device flag and the input/output mode of the spooled device. Legal values are: 00 - not spooled 01 - illegal 10 - input spooling 11 - output spooling
ACBSPREC	This is the record size, in bytes, of the spooled device. Applicable if the file access is to a spooled device.
ACBSPTYPE	This is the device type (from the LDT) of the spooled device. Applicable if the file access is to a spooled device.
ACBSPTYAC	This cell contains the spooled device type and record size, which are described separately.

G.00.00
6- 31

File System

ACBSPOVEV	This is the logical device number of the spooled device. Applicable if the file access is to a spooled device.
ACBSPOXOX	This is the index into the IOO or OOD for a spoolfile. Applicable if the file access is to either a spooled device or a spoolfile.
ACBSTATUS	This is the last I/O status for the file. It comes from the I/O status part of the IOCB returned by ATTACHIO. Not all ATTACHIO calls update this cell.
ACBSTOPCHAR	This is the record termination character used for terminal reads. This character can be changed via FCONTROL(25).
ACBSTREAM	This bit signifies inter-block garbage for disc files. If set, the block size is a multiple of 128 words and therefore there is no garbage data between blocks. This fact is used to improve multi-record I/O by mapping the request into as few ATTACHIOs as possible.
ACBSUBCL	This is the sub-class part of the device type number. The sub-class is unique for each access class. The following are the legal sub-class values for each device class: 0 - direct 0 - moving head disc 1 - fixed head disc 7 - foreign disc 1 - serial input 0 - card reader 1 - paper tape reader 2 - parallel input/output 0 - terminal 4 - card reader/punch 6 - SSLC 7 - programmable controller 3 - serial input/output 0 - magnetic tape 7 - serial disc 4 - serial output 0 - line printer 1 - card punch 2 - paper tape punch 3 - CALCOMP 500 plotter 4 - CALCOMP 600 plotter 5 - CALCOMP 700 plotter

G.00.00
6- 32

File System

ACBTPEERROR	This bit controls the reporting of recovered magnetic errors. If not set the recovered errors are not reported to the user; if set then recovered errors are reported to the user by returning CCL and error number 39. Valid if the file is a magnetic tape file. This bit is adjusted by FSETMODE.
ACBTBLOCK	This bit controls block mode transfers on the 2644 page mode terminal. This bit is adjusted by FCONTROL(28) and FCONTROL(29).
ACBTLOG	This is the last I/O transmission log for the file. It comes from the I/O transmission log part of the IOCB returned by ATTACHIO. Not all ATTACHIO calls update this cell.
ACBVDRDDR	This is the volume table index for the file. Applicable if the file is a disc file.
ACBMITCRLF	This bit controls CR and LF insertion into the user buffer on the 2644 page mode terminal. This bit is adjusted by FCONTROL(30) and FCONTROL(31).

G.00.00
6- 33

File System

If present, the PRCB buffering extension contains from one to sixteen block buffers each having the following format:

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15		
IOQ ENTRY INDEX																0	BLKIOQK
BLK LDEV NUMBER																1	BLKFLAGH
IOCB - STATUS																2	BLKLSTRT
IOCB - TRANSMISSION LOG																3	BLKLLOG
BLOCK NUMBER																4	BLKBLOCK
																5	
BLOCK SECTOR ADDRESS																6	BLKDADDR
																7	
BLOCK EXTENT BASE																8	BLKEXTBASE
																9	
BLOCK EXTENT SIZE																10	BLKEKTSIZE
UNUSED																11	
																12	BLKBUFFER
BUFFER																	

Other identifiers used:

BLKFLAGH	= BLK(1)H,	Flag and LDEV word
BLKLDEV	= BLKFLAGH.(0:8)H,	block logical device number
BLKFLAGS	= BLKFLAGH.(0:8)H,	block I/O flags
BLKUNALLOCENT	= BLKFLAGH.(10:1),	Block from unalloc. extent
BLKREVERSE	= BLKFLAGH.(11:1),	FREREADBACKWARD (not used)
BLKDONTWRIT	= BLKFLAGH.(12:1),	I/O status not checked
BLKIOOUT	= BLKFLAGH.(13:1)H,	last I/O was write?
BLKDIRTY	= BLKFLAGH.(14:1)H,	buffer modified?
BLKIOPEND	= BLKFLAGH.(15:1)H,	I/O in progress?
BLKIOCOMP	= BLKFLAGH.(14:2)H,	I/O complete - not dirty
BLKIOCB	= BLKDBL(1)H,	IOCB

G.00.00
6- 34

File System

Discussion:

BLKBLOCK	This is the block number of the data contained in the buffer. A value of -10 indicates that the buffer is empty.
BLKBUFFER	This is the actual file system buffer space. Each buffer is exactly one file block in size.
BLKDADDR	This is the block's logical device and sector number.
BLKDIRTY	This flag is set if the contents of the buffer has been modified. When the block buffer is re-used this flag is checked to see if the block needs to be written to the device.
BLKDONTWRIT	This bit will be on if the I/O was already completed via "DONTWRIT" but the status has not been checked yet. Check the status before using the block in the buffer.
BLKEXTBASE	This is the sector address of the extent base in which the block resides. This is used for disc caching.
BLKEKTSIZE	The size, in sectors, of the extent in which the block resides. This is used for disc caching.
BLKFLAGS	These are the miscellaneous flags associated with the block, which are described separately.
BLKIOCB	This is the IOCB returned by the I/O system when the block I/O has completed. On a blocked I/O request this is obtained from the ATTACHIO call; on an unblocked I/O request this is obtained from WAITFORIO.
BLKIOCOMP	This is the buffer modified flag (BLKDIRTY) and the I/O in progress flag (BLKIOPEND), which are described separately. This field is usually interrogated to see if it contains the value 2, which means that the buffer has been modified but not yet written to the device.
BLKIOOUT	This is the mode of the I/O operation for the block. It is set by a write and cleared by a read.
BLKIOPEND	This is the I/O in progress flag. It is set if the I/O is pending; it is cleared when the I/O has completed.
BLKIOQK	This is the IOQ index of the unblocked I/O request for the block. It is used as the argument to WAITFORIO, which ensures the completion of the I/O request.
BLKLDEV	This is the logical device number of the block. (Valid only for disc files.)

G.00.00
6- 35

File System

BLKLSTRT	The I/O status part of the IOCB consists of the PCB number and the error code for the completed I/O request.
BLKLLOG	The transmission log part of the IOCB is the number of words or bytes transferred by the I/O request.
BLKREVERSE	This bit would indicate that we are reading backwards from a tape. However, currently FREREADBACKWARDS can only be performed unbuffered.
BLKUNALLOCENT	This bit signifies that the block was "read" from an unallocated extent. Actually, the buffer was simply cleared with fill characters. Therefore, if a write is attempted to the block residing in this buffer, it must pass through FCONVBK to allocate the extent first.

G.00.00
6- 36

File Control Block (FCB)

The FCB coordinates access to a file on a sharable device. At present the only sharable device is a disc, so only disc files have FCBs.

The information contained in an FCB is derived from the file label. The FCB is used to hold this information, rather than the file label, since it can be accessed more quickly.

There are two strategies to choose from in deciding where to place the FCB. If the file has been opened exclusive and no other process could possibly share this file, then the FCB is placed into the PKFILE area (or in a NOBUF expandable CBT if it won't fit in the PKFILE area or if the program is run with NOCB). If the file could possibly be shared, then the FCB is always placed in a shared control block table. The number of a data segment containing a list of shared file system data segments is kept in system global location 1076 octal. The size of the FCB depends on the maximum number of extents specified at FOPEN; there are 44 (octal) words plus two per extent. There will be at least one extent, since the file label always exists in the first extent. The FCB extent map is in terms of logical device and sector number. The extent map in the file label is in terms of volume rather than logical device; the map is converted by VTABLEDEV when the label is read, and converted back by LDEVTOVTAB when the label is written to disc.

The FCB has the following format:

0	1	2	3	7	8	12	13	14	15
0	1								
1									
2									
3									
4									
5									
6

FCBLABEL	= FCB(36).(18:18)W,	label LDEV and sector
FCBLDEV	= FCB(36).(0:8)W,	label LDEV

Discussion:

FCBCBOST	This is the OST of the ACB that was created at the same time as the FCB. This is used in conjunction with FCBNEWCBOST when relocating the FCB.
FCBCBVB	This is the vector table entry of the ACB that was created at the same time as the FCB. This is used in conjunction with FCBNEWCBVB when relocating the FCB.
FCBAN	This is the account name of the file. It is eight bytes in length with trailing blanks added.
FCBBLKFACT	This is the blocking factor of the file. It is the number of logical records in a physical block. Legal values range from 1 to 255.
FCBDEVICE	This specifies the device on which the file resides. If it is positive then it represents a logical device number; if negative it represents a (negative) device class index.

G.00.00
6- 39

FCBOISP	This is the pending FCLOSE disposition for the file. Legal values are: 0 - no change 1 - save permanent 2 - save temporary and rewind 3 - save temporary but do not rewind 4 - release 7 - invalid file (file label access error)
FCBCRUNCH	This bit governs if space will be returned beyond the EOF upon the last FCLOSE of the file. 0 - no change 1 - return space beyond EOF
FCBTYPE	This is the device type number of the first extent of the file. See ACTYPE for a list of legal values.
FCBEND	Block number of the file's EOF, relative to FCBSTART.
FCBEOF	This is the end-of-file pointer for the file. It is a double integer representing the number of records in the file. It can also be viewed as the record number of the next record past EOF.
FCBEXCLSTAT	This is the exclusive status of the file access. If -1 then the file is being accessed exclusively; otherwise it is the number of semi-exclusive accessors.
FCBEXTMAP	This is the extent map of the file. The number of extents is specified by FCBNUMKTS; a 00 extent descriptor indicates that the extent has not been allocated.
FCBEXTSIZE	This is the extent size, in sectors, of the file. All extents in the file except possibly the last have this size. This is a logical value, and legal values range from 1 to 65535 sectors. This restricts the maximum file size to 2097120 sectors (268,431,360 words).
FCBFLIM	This is the end-of-space pointer for the file. It is a double word integer representing the maximum number of records (fixed length record format) or blocks (undefined or variable length record format) in the file.
FCBFOPTIONS	This is the FOPTIONS in effect for the file.
FCBGN	This is the group name of the file. It is eight bytes long with trailing blanks added.
FCBLOSEL	This is the logical device and sector number of the file label, which is the same as the first extent descriptor.

G.00.00
6- 40

File System

FCBLASTEXTSIZE	This is the size, in sectors, of the last extent in the file. If the file has one extent then this is the same as FCBEKTSIZE; otherwise this value may be different from FCBEKTSIZE. This is the size of the last physical extent for the file; it is not the size of the last allocated extent.
FCBLBL	This is the number of user labels allocated for the file. Since each label is a sector long, this is also the number of sectors allocated for user labels.
FCBLBLEOF	This is the end-of-data pointer for the user labels. It is analogous to FCBEOF in that it represents the number of labels written. The initial value is 0.
FCBLDEV	This is the logical device number of the first extent of the file.
FCBLKST	This is the previous lock state of the file and is derived from the file label. Legal values are: 0 - no accessors 1 - read 2 - write 3 - read/write
FCBMVTABX	If the file resides on a private volume, then this field represents the mounted volume table index of the volume set entry on which the file resides.
FCBNEWFCBST	This is the OST of the new FCB for the file. It is used in conjunction with FCBCBST to move the FCB to a system (shared FCB) control block table when the second accessor is established. If this value is zero then there is no new FCB; if nonzero then a new FCB has been created.
FCBNEWFCBV	This is the vector table entry of the new FCB for the file. It is used in conjunction with FCBCBV to move the FCB to a system (shared FCB) control block table when the second accessor is established. If this value is zero then there is no new FCB; if nonzero then a new FCB has been created.
FCBNUMEXTS	This is the maximum number of extents, less one, allowed for the file. It is not the number of extents presently allocated, which is always determined by counting nonzero entries in the extent map.
FCBNUMOPENCLSRC	Number of open and close records in the message file.

G.00.00
6- 41

File System

FCBOCNT	This is the number of accessors for the file. Alternatively it can be viewed as the number of PCBs created for the file.
FCBOCNTIN	This is the number of file accessors having input access.
FCBOCNTOUT	This is the number of file accessors having output access.
FCBRIN	This is the RIN number used to support dynamic locking (i.e. FLOCK and FUNLOCK) for the file. If there is no dynamic locking then this number is zero.
FCBSECTOFF	This is the sector offset from the file label to the first block of the file. This is not necessarily equal to FCBLBL+1 since an integral number of blocks are allocated for the file and user labels.
FCBSECTPBLK	This is the number of sectors in a block for the file.
FCBSIZE	This is the size, in words, of the complete FCB. It includes the extent map.
FCBSTART	Block number of the file's start, excluding the file label block.
FCBSUBTYPE	This is the device subtype number of the first extent.
FCBUSERLBL	This field describes the user labels for the file. It consists of FCBLBL and FCBLBLEOF, described separately.
FCBVMASK	If the file resides on a private volume set, this bit mask signifies which volume of the set in which the file resides. Bit 15 is on it resides on the first volume, bit 14 if on the second, etc.

File System

FLASTORE = FLAB(28).(1:1)N, file being restored
 (FLLOAD) = FLAB(28).(2:1)N, File loaded
 FLEACL = FLAB(28).(3:1)N, exclusive access
 FLRA = FLAB(28).(0:2)N, S & R bits
 (FLSRXL) = FLAB(28).(0:3)N, S, R, & L bits
 FLSTRTYPE = FLAB(28).(0:4)N, S, R, L, & K bits
 FLSTRTYPE = FLAB(28).(4:4)N, device subtype
 FLSTRTYPE = FLAB(28).(8:6)N, device type
 FLSTATUS = FLAB(28).(14:2)N, write/read status
 (FLBLEOF) = FLAB(29).(0:8)N, no. labels written
 (FLBL) = FLAB(29).(8:8)N, no. labels available
 FLSECTOFF = FLAB(39).(0:8)N, sector offset to data
 FLNUMEXTS = FLAB(39).(11:5)N, no. extents less 1
 FLABEL = FLAB(44).(22)N, label VTRAB and sector
 FLVTRAB = FLAB(44).(0:8)N, label VTRAB index

Discussion:

FLACCTHNAME This is the account name of the file. It is eight bytes in length with trailing blanks added.
 FLALLOCDATE Date that the file was allocated on this system.
 FLALLOCTIME Doubleword containing the time that the file was allocated on this system.
 FLBLKSIZE This is the block size, in sectors, of the file.
 FLCHECKSUM This is the exclusive-OR checksum of the file label (excluding words 34, 42, and 43 octal) and is used for error detection. Each time the file label is read from disc the check sum is calculated and compared against the value recorded in the file label. Similarly, each time the file label is written to the disc the check sum is calculated and inserted into the file label.
 FLCLOD This is the cold load number in effect the last time that the file was accessed. This should always be the current cold load number. If it is not, it means that the system crashed while the file was open and that the data in the File label should be "reset" (principally the FCB vector FLCBVECT).
 FLCREATE This is the creation date of the file. It is in the format defined by the intrinsic CALENDAR.
 FLDEVNAME This is the FDEPH device specification that was used when the file was created. This information is needed when new extents are allocated.
 FLDTYPE This is the device type number of the first extent of the file; see ACBDTYPE for a list of legal values. This value is determined by configuration.

 G.00.00
 6- 46

File System

FLEND Number of current data blocks (that is, the end of file block number relative to the start of file).
 FLEOF This is the end-of-file pointer for the file. It is a double word integer representing the number of records in the file. It can also be viewed as the record number of the next record past EOF.
 FLEACL This is the exclusive access flag for the File. If set it means that the file has been opened exclusively by a single accessor. If not set then the file is potentially accessible by others.
 FLEXTMAP This is the extent map of the file. The number of extents is specified by FLNUMEXTS; a 0D extent descriptor indicates that the extent has not been allocated.
 FLEXTSIZE This is the extent size, in sectors, of the file. All extents in the file, except the last, have this extent size. This is a logical value, and legal values range from 1 to 65535 sectors. This limits the maximum file size to 2097120 sectors.
 FLCBVECT If nonzero, this is the vector of the FCB for the file. If zero, the File is not being accessed.
 FILEICODE This is the file code of the file. Known values are:

FLFLIM This is the end-of-space pointer for the file. It is a double integer representing the maximum number of

 G.00.00
 6- 48

File System

records (fixed length record format) or blocks (undefined or variable length record format) in the file.

FLFOPTIONS This is the FFOPTIONS of the file.

FLGRPNAME This is the group name of the file. It is eight bytes long with trailing blanks added.

FLLABEL This is the volume table index and sector number of the file label, which is the same as the first extent descriptor. **FLLASTACC** This is the last access date of the file. It is in the format defined by the intrinsic **CALENDAR**.

FLLASTMOD This is the last modification date of the file. It is in the format defined by the intrinsic **CALENDAR**.

FLLASTTEXTSIZE This is the size, in sectors, of the last extent in the file. If the file has one extent, then this is the same as **FLEXTSIZE**; if the file has more than one extent, then this value may be different from **FLEXTSIZE**. This is the size of the last physical extent for the file; it is not the size of the last allocated extent.

FLLBL This is the number of user labels allocated for the file. Since each label is a sector long, this is also the number of sectors allocated for user labels.

FLBLEOF This is the end-of-data pointer for the user labels. It is analogous to **FLEOF** in that it represents the number of labels written.

FLLOAD This is the **LOADED** flag for the file. If set, it means that the file is a loaded program or **SL** file and cannot be modified except by a privileged accessor. This flag is set and cleared by the loader, not the file system.

FLLOCK This identifies the word containing the lock bits, which are described separately.

FLLOCKWORD This is the lock word of the file. It is eight bytes long with trailing blanks added. If it is all blanks, then the file does not have a lockword.

FLLOCNAME This is the local name of the file. It is eight bytes long with trailing blanks added.

FLNUMEXTS This is the number of extents, less one, allowed for the file. It is not the number of extents allocated. Legal values range from 0 to 31, i. e., 1 to 32 extents.

FLNUMOPENCLSRC Number of open and close records in the message file.

G.00.00
6- 49

File System

FLPVINFO File label private volume information. This is in the same format as the **FCBPVINFO**.

FLRECSIZE This is the record size of the file in negative bytes.

FLRESTORE This is the **RESTORE** flag for the file. If set, it means that the file is being **RESTORED** and cannot be accessed. **RESTORE** also sets the **STORE** bit for the file (**FLSTORE**); see **FLSR** for a full description of the use of these bits. This flag is set and cleared by **STORE/RESTORE**, not the file system.

FLSECAX This is the security matrix of the file. The bits are organized into five groups of six bits each. (Bits 0:2 are not used.) The groups correspond to the access types: **READ**, **APPEND**, **WRITE**, **LOCK**, and **EXECUTE**. Within each group, each bit specifies who may have the access: **ANY**, **ACCOUNT MGR**, **ACCOUNT LIB- RARIAN**, **GROUP**, **GROUP LIBRARIAN**, **CREATOR**.

FLSECTOFF This is the sector offset from the file label to the first block of the file. This is not necessarily equal to **FLLBL+1** since an integral number of blocks are allocated for the file and user labels.

FLSECURE This is the file security enforcement flag for the file. If not set, then the file has been **RELEASED** and the security matrix **FLSECAX** should be ignored. If set, then secure as specified by the security matrix.

FLSR This is the **STORE** and **RESTORE** flags for the file, which are described separately. **STORE** and **RESTORE** decode the two-bit field to indicate their operation. Legal values are:

- 0 - file not in use by either **STORE** or **RESTORE**
- 1 - illegal value
- 2 - file being **STORED**
- 3 - file being **RESTORED**

The file system interprets the leftmost bit as indicating that the file is being accessed by either **STORE** or **RESTORE**. The rightmost bit is interpreted as indicating what access should be permitted: 0 (file being **STORED**) allows read access; 1 (file being **RESTORED**) allows no access. This field is set and reset by **STORE/RESTORE**, not the file system.

FLSRL This is the **STORE**, **RESTORE** and **LOADED** flags for the file, which are described separately.

FLSALX This is the **STORE**, **RESTORE**, **LOADED** and exclusive flags for the file, which are described separately.

FLSARELEASE This flag is used by **STORE/RESTORE**. If a file is **STORED** with the **"RELEASE"** keyword, **STORE** will set this flag

G.00.00
6- 50

File System

in the tape copy of the file label. **RESTORE** will allow any user to access such files, regardless of the file's normal security. If this bit is off in the tape copy of the file label, **RESTORE** applies normal security checks (as defined by the information in **FLSECAX** and **FLSECURE**). This bit is zero for files on disc.

FLSTART Block number of the file's start, excluding the file label block.

FLSTATUS This is the read/write status of the file. Legal values are:

- 0 - no accessors
- 1 - read
- 2 - write
- 3 - read/write

FLSTORE This is the **STORE/RESTORE** flag for the file. If set it means that the file is being either **STORED** or **RESTORED**. The **RESTORE** bit (**FLRESTORE**) must be interrogated to determine which operation is taking place; see **FLSR** for a full description of the use of these bits. This flag is set and cleared by **STORE/RESTORE**, not the file system.

FLSUBTYPE This is the device subtype number of the first extent of the file. This value is determined by configuration.

FLUSERID This is the creating user name of the file. It is eight bytes long with trailing blanks added.

FLUSERLBL This field describes the user labels of the file. It consists of **FLLBL** and **FLBLEOF**, which are described separately.

FLVTAB This is the volume table index of the first extent of the file.

G.00.00
6- 51

File System

File Multi-Access Vector Table (FMAVT) DST(X54)

The **FMAVT** is used to locate shared **PACB**'s for files opened multi-access. When an old disc file has been opened multi-access, the **FMAVT** is searched to determine if the file has previously been opened. The **JTIDST** and the **DADOR** found in the **FMAVT** are compared to the **JTIDST** of the job and the **DADOR** of the device or disc file being opened multi-access. If an entry exists for the file, then the **PACB** can be easily located for that file. If this is the first process opening the file, then an entry is created and inserted into the **FMAVT** for the file.

Spoolfiles are opened multi-access, therefore, they will have entries in the **FMAVT**. **\$STOIN** and **\$STOLIST** also have entries in the **FMAVT** since they too are opened multi-access.

Zero Entry Format

CURRENT TABLE SIZE	0 FM'CURR'SIZE
ENTRY SIZE = 6	1 FM'ENTRY'SIZE
MAXIMUM TABLE SIZE	2 FM'MAX'SIZE
0	3
0	4
0	5

Descriptions:

FM'CURR'SIZE The current size of the **FMAVT** in words. This value increases in increments of **X200** words until **FM'MAX'SIZE** is reached.

FM'MAX'SIZE The maximum allowable size in words that the **FM'CURR'SIZE** can get. The current value of this is **14000**. **FM'MAX'SIZE** can be changed only by changing the code in Initial. The open of the multi-access file is failed if this maximum is reached.

FM'ENTRY'SIZE Size in words of an **FMAVT** entry, 6 words at present.

G.00.00

FN'DEVICE = FNAV(0).(2:1)N, Device bit
 FN'GLOBAL = FNAV(0).(1:1)N, Global multi-access bit
 FN'LDEV = FN'DADDR(0).(0:8)N, Logical device number of file

Descriptions:

FN'DADDR The disc address of the File label for disc files. For device files, the disc address is zero.
 FN'DEVICE This bit is 1 for device files and 0 for disc files.
 FN'LDEV Logical device number of device files or the LDEV of the disc containing the file label for disc files.
 FN'JITDST The DST number of the JII for the job that has the file open. If this field is nonzero, then only processes in the family tree of this particular job can open the file. This field is zero if the file was open global multi-access.
 FN'GLOBAL This bit is 1 if the file was opened global multi-access, this allows multi-access to the file between jobs.
 FN'PCBV The PCB vector for this multi-access file. Used to easily find the Physical Access Control Block for files opened multi-access.

6.00.00
 6- 53

System Global Area (SYSGLDB)

The file system uses several words in the system global area for its own use.

SHFCBDST = SYSDB+X76, shared CBT DST no.
 MONITOR = SYSDB+X77, monitoring flag word
 MAXSECT = SYSDB+X100, max W spoolfile sectors
 WUMSSECT = SYSDB+X102, current W spoolfile extent
 EXTSECT = SYSDB+X104, W sectors/spoolfile extent
 SPOOLINDEX = SYSDB+X132, class spool index
 CSIDWAIT = SYSDB+X135, CSIDWAIT PLABEL
 CCLDSEPLABL = SYSDB+X140, CS CCLDSE PLABEL - FPRDCTERM
 DSCNKLPLABL = SYSDB+X335, DSCNECK PLABEL
 OSDPENPLABL = SYSDB+X336, OSDPEN PLABEL
 DSCLOSEPLABL = SYSDB+X337, DSCLOSE PLABEL
 SDSLDEVLABL = SYSDB+X323, PLABEL for SDSLDEV
 MANWCPLABL = SYSDB+X340; MANAGEWRITECDW PLABEL
 GLOBALAFTDST = SYSGLBEXT+X121 Global AFT DST number

SIRs, Locks, and Deadlocks

The file system uses two SIRs: the File SIR, which is intended to protect file label integrity, and the FNAV SIR, which is to guarantee the integrity of the FNAV. Since the File system locks these resources and also locks control blocks, deadlocks can occur if locking is done in the wrong order. Not only must the file system handle locking correctly, but the entire ensemble of the file system, its callers, and its callees must do so also. These include CSAM, which has a SIR of its own, SYSDUMP, and STORE, which lock the File SIR because they tweak bits in file labels. The presently accepted order is:

Get FNAV SIR Lock ACB Get File SIR Lock FCB

It may not be necessary to do all of these things in any particular procedure. In modifying a procedure, you should be sure that any of these locks which you change are consistent not only within your own code, but also with its callers and callees.

6.00.00
 6- 54

Shared CBT DST

In sysglobal X76 (ABSOLUTE X1076) there exists the shared Control Block Table DST number. This DST holds a list of shared CBT's. Shared CBT's are used to keep any and all file system control blocks that have the potential to be shared between processes. Any disc file opened shared will have its FCB kept in one of these CBT's. Also, all terminal PCB's will be stored in a system shared CBT so that an extra data segment is not wasted. This is possible because all terminal access is performed MBOUF, which means that the PCB will be a minimal PCB and can be placed in these CBT's. Lastly, any file opened with global file access will have all its control blocks placed into these system CBT's.

The format of the system shared CBT DST is similar to a Control Block Table. It has the same words of overhead and the data (the list of DST's) starts in the next word after the overhead. The system CBT's are created one at a time as needed. Usually, there are only a few DST's in the list.

CHAPTER 7 PROCESS TABLES

The operating system maintains state, control, and accounting information on each process. The data structures for this purpose are the process control block table (PCB; core resident, 1 entry per process) and the process control block extension (PCBX; contained in the process' stack below OL). Process related information which must be accessible when the process' stack is not present in main memory is maintained in the process' PCB entry. All other process related information is maintained in the process' PCBX.

A process is identified in the system by its PCB entry number, referred to as its PIN (process identification number), or by its PCBPT=(PIN)*(PCB entry size).

The structure of the PCB table, PCB entry format, PCBX structure, and PCBX format are specified in this chapter.

Process Control Block Table Structure and Format

Process

Process To Process Communication Table

This table is used as the communication link by which father and son processes communicate with one another via the mailbox scheme. This table contains two words per entry and is indexed by PCB# (entry index 0 is meaningless). Each two word entry of index N essentially relates where, as well as how much, mail may be found for a process N with respect to communications between N and his father process.

ENTRY FORMAT

word 0	WORD COUNT
word 1	MAIL WORD OR DSTN

where word 0 = the # of mail words to be transferred.
 word 1 = the only word of mail itself if word 0 = 1
 otherwise
 it contains the DST# of the extra data segment where "word count" words of mail exist.

NOTE: Assume process S is the son of process F. Then the process to process communication table index which will be used for mailbox communication between son S and father F will be that of the son (i.e. S).

FDRTRN Logical Unit Table (FLUT)

The segmenter is responsible for the preparation and initialization of a FDRTRN logical unit table. This is done when a program is prepared if that program contains at least one program unit that references a logical unit. The location of the FLUT is in the secondary DB area and the address of this location is contained in DB-1.

The FLUT is formatted as per the following example:

DB-1	-----	X
	-----	-----
DB+X	3 0	
	---	4 0
	---	5 0
	7 0	
	---	10 0
	255 ///	
	^	^
	-----	-----
	1st BYTE	2nd BYTE
List of the logical unit numbers referred to in this FORTRM-produced program. (255 terminates).	The MPE file number (as returned by FDPEN) used in accessing the file. Zero if file not open. Filled in by formatter as each l.u. is initially referenced.

Job Process Count Table (JPCNT)

(1 Bit Entry/Running Job)

MEMORY RESIDENT

SYSGLOB BASE = DB+13(X15)
DST = 24(10)
SIR = 13(10)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	Total Configured number of Jobs and Sessions														
1	Total number of free entries														
2	Bit Map relative index of word containing next free entry														
3	unused														
4	Bit Map														
	64 words long														

free entry = 1
allocated entry = 0

A JPCNT entry must be allocated before the main process can be procreated.

The job SIR (PXGJSIR) = some base+JPCNT index.

NOTE: This table is completely bit oriented with each entry consisting of one bit. Entries are taken from available pool on a "first found" basis. A "1" found in the bit map indicates a free entry. A zero (0) found in the bit map indicates an allocated entry. Word 2 of this table is the index of the word in the Bit Map where the next free entry resides. At system start up, this word is set to zero (0). The Bit Map can be thought of as ranging from 0-63 (64 total words - 1024 entries).

G.00.00

Allow Mask Format

The Allow mask for MPE V is expanded to six words. There is a mask in each user's JIT and in the SYSGLIB area. The Allow mask contains enough bits for a one-to-one correspondence to every present OPERATOR type command, or any future OPERATOR command. When a user is ALLOWED any OPERATOR command or ASSOCIATED to a device (which will use OPERATOR type commands) then the corresponding bit(s) in the mask in that user's JIT for that command is set. If the ALLOW or ASSOCIATE was done on a global scale, then the bit(s) in the mask of the SYSGLIB area is/are updated.

The following EQUATEs define the mask bit for each operator command.

The first set of commands define the operator commands dealing with devices.

5.00.00
8- 11

When adding a new command to this set of EQUATEs, be sure to add a corresponding move statement in LOGIRAGE, even if the command will not be logged.

CHAPTER 9. RELOCATABLE OBJECT CODE

USL Files Introduction

- * USL record length 128 words always.
- * Layout of doubleword disc addresses

- * Hash links join all entries with the same hash key regardless of type.
- * Linear lists terminate with a zero link
- * Circular lists containing only the list head point directly to themselves.
- * Single-word disc addresses

Uninitialized fields are reserved for future use and should be set to zero.

NOTE: A descriptor of 0 results in an automatic match.

Pascal

Pascal sets the high order bit in the parameter type descriptor when it is generating hashed values. The remaining 15 bits are based on a hash of the types of the parameter. Only the Pascal compiler can compute the value, and the SEGMENTER must match the whole 16 bit value.

Clarification Notes on Entry Types 2 and 4
With Respect to SPL and FORTRAN

*ENTRY TYPE 2 SPL D.B.	**ENTRY TYPE 4 SPL PROC	*ENTRY TYPE 2 FORTRAN MAIN	*ENTRY TYPE 4 FORTRAN SUB.
TPDB	0	0	0
1,5 TSDB	1 TSDB	1,2,3,4 TSDB	1,2,3,4 TSDB
NWPUST	NWPUST	NWPUST	NWPUST
5 NWSDB	NWD	NWD	NWD

WHERE: TPDB = Total primary DB length in words
TSDB = Total secondary DB length in words
NWPUST = Number of words in "TRCE" array
NWSDB = Number of words in secondary DB array
NWD = Number of words in own array
NWD = Number of words in data array

Notes: 1. Does not include the length of the STLT
2. Does not include the length of the FLUT
3. Does not include the length of any common array
4. Includes the length of any DB-allocated format array
5. Are not necessarily equal

In general TPDB and TSDB are summations of storage allocated in the global area of the program's data segment. They are not, however, complete since the compilers are not aware of all storage actually allocated. The STLT and FLUT are examples of this since these tables are constructed by the segmenter. Common arrays also present a problem since their inclusion in TPDB and TSDB might cause their storage requirements to be counted more than once.

Storage Management

FILE SPACE IS MANAGED IN TERMS OF 32 WORD BLOCKS (4 BLOCKS PER 128 WORD RECORD).

FREE SPACE (BLOCKS) IS ACCOUNTED FOR IN A BIT MAP, WHICH IS PARTITIONED INTO RECORDS (2K BLOCKS PER SECTION). A 0 INDICATES THAT A BLOCK IS USED, A 1 INDICATES THAT IT IS FREE.

FILE SPACE IS ALSO PARTITIONED INTO 512 RECORD SECTIONS (64 MAX. SECTIONS, 2N BLOCKS PER SECTION, 1 MAP PER SECTION). THE NUMBER OF SECTIONS IN A FILE IS NS=(FL+511) / LSA(9). THE FIRST NS RECORDS FOLLOWING RECORD 0 (RECORDS 1 TO NS) ARE RESERVED FOR THE SECTION MAPS.

A COMPLETE FILE ADDRESS WOULD HAVE THE FOLLOWING CONFIGURATION:

FILE (WORD) ADDRESS
DOUBLE WORD

G.00.00
9-31

Entry Point Directory

THE DIRECTORY IS PARTITIONED INTO 95 NASH LISTS (SAME NASH FUNCTION AS USL); EACH NASH LIST IS A LINED LIST OF RECORDS.

EACH RECORD CONTAINS A SUCCESSOR LINK (RECORD #) AND A USED SPACE COUNT. A LINK OF 0 TERMINATES A LIST. WHEN A RECORD IS VOID OF ENTRIES (USED=2), ITS SPACE IS RETURNED TO THE FREE STORAGE AREA.

Storage Management

FILE SOURCE IS MANAGED IN TERMS OF 128 WORD BLOCKS (1 BLOCK PER 128 WORD RECORD).

FREE SPACE (BLOCKS) IS ACCOUNTED FOR IN A BIT MAP, WHICH IS PARTITIONED INTO RECORDS (2K BLOCKS PER SECTION). A 0 INDICATES THAT A BLOCK IS USED; 1 INDICATES THAT IT IS FREE.

FILE SPACE IS ALSO PARTITIONED INTO 2048 RECORD SECTIONS (16 MAX. SECTIONS, 2K BLOCKS PER SECTION 1 MAP REC SECTION). THE NUMBER OF SECTIONS IN A FILE IS $NS=(FL+2047) \text{ AND } LSA(7)$. THE FIRST NS RECORDS FOLLOWING RECORDS 0, 1 (RECORDS 2 TO NS+1) ARE RESERVED FOR THE SECTION MAPS.

IF THE SECTION MAPS SPECIFY MORE SPACE THAN IS POTENTIALLY AVAILABLE, THOSE RECORDS BEYOND FLIMIT ARE MARKED AS "USED".

Entry Point Directory

THE DIRECTORY IS PARTITIONED INTO 95 HASH LISTS (SAME HASH FUNCTION AS USL);
EACH HASH LIST IS A LINKED LIST OF RECORDS.

EACH RECORD CONTAINS R SUCCESSOR LINK (RECDAD #) AND R USED SPACE COUNT. R LINK OF 0 TERMINATES R LIST. WHEN A RECORD IS VOID OF ENTRIES (USED=2), ITS SPACE IS RETURNED TO THE FREE STORAGE AREA.

THE HASH LIST HEAD POINTERS (HL IN THE DIAGRAM ABOVE) ARE IN RECORD 0 WORDS
X41 TO X177.

Code Segment Linkage Structure

EACH CODE SEGMENT OCCURS AN INTEGRAL NUMBER OF RECORDS. THIS BLOCK OF INFORMATION CAN BE SUBDIVIDED INTO THREE TABLES: THE CODE SEGMENT RORER, AN STT SEGMENT MRR ARRAY, AND AN EXTERNAL LIST.

STT MRP ARRAY

R 1 BYTE X 256 BYTE ARRAY. IT IS INDEXED BY STT NUMBER AND RETURNS (IF THE STT CORRESPONDS TO AN EXTERNAL OF THE SEGMENT) THE SEGMENT NUMBER OF THE EXTERNAL AND 255 OTHERWISE. THIS ARRAY IS USED WHENEVER THE SEGMENT IS LOADED AND IS SORTED WHENEVER THE SL IS BOUND BY THE SEGMENTER.

EXTERNAL LIST

A SYMBOLIC LIST OF THE EXTERNALS OF THE SEGMENT. EACH ENTRY CONTAINS INFORMATION ABOUT THE EXTERNAL: PARAMETER CHECKING LEVEL AND PARAMETER MATCHING INFORMATION, AND THE SEGMENT NUMBER AND STT NUMBER IF THE EXTERNAL IS SATISFIED WITHIN THE SL.

Reference Table Structure

FOR EACH SEGMENT THERE IS A REFERENCE TABLE ENTRY OF 32 WORDS. THE REFERENCE TABLE ENTRIES ARE PACKED FOUR TO A RECORD. THE RECORDS CONTAINING THE REFERENCE TABLE ENTRIES ARE LISTED IN RECORD 1. THE RECORD CONTAINING REFERENCE TABLE ENTRY N IS REC 1 (N.(0 : 14)); THE FIRST WORD OF THE ENTRY IS REFTRB (N.(14 : 2) & LSL (5)).

WHEN A SEGMENT IS DELETED, THE REFERENCE TABLE ENTRY CORRESPONDING TO THE SEGMENT IS RELEASED. THESE FREE ENTRIES ARE LINKED TOGETHER IN A LIST; THE SEGMENT # IS USED AS A LINK AND IS PLACED IN THE FIRST WORD OF THE ENTRY.

WHEN A SEGMENT IS ADDED IT IS ASSIGNED A SEGMENT NUMBER (0 LESS THAN/EQUAL TO N LESS THAN/EQUAL TO 254); THE NUMBER IS THE FIRST FREE REFERENCE TABLE ENTRY, OR, IF NONE ARE FREE, THE NEXT AVAILABLE REFERENCE TABLE ENTRY (CRUISING SPACE ALLOCATION FOR THE ENTRY).

CHAPTER 11 LOADER

MPE Loader

The loader is a system process which will do loads sequentially. If a process needs code to be loaded, it will get the load process' SIR, fill loader communication table, and then awake the loader. Upon completion, the loader will return its status through the loader communication table, and then activate the waiting process.

Loader Segment Table Overview

Loader Segment Table consists of two DST's. The main one is DST X22 (LST). The other DST (XLST) has its DST number stored in SYSGL0B X226.

LST Overview

G.00.00
11- 1

XLST Overview

The above DST's has exactly the same primary DB area so that directory entry handling procedures can be used on both DST's. XLST is the LST extension and is used to store the extension entry only. When an extension entry is needed, it is copied into the LST to eliminate frequent EXCHANGE0B. Note that XLST is capable for any types of entries. It is used for extension entry only for now. Also, some of the primary DB's in the XLST are not used. They are there just for the consistency.

G.00.00
11- 13Logical Segment Transform Table (LSTT)

When a process references any user SL segments, these segments are assigned logical segment numbers if the new mapping ucode is running. The LSTT provides a map mapping these logical segments into their physical segment numbers and having true STT's for the mapped segments. The LSTT is created by LOADER during the load time. It occupies an OST and the DST number is stored in PCB(15). If no user SL segment is referenced, the LSTT will not be needed, hence it will not be created.

The new mapping microcode depends on the existence of the LSTT for getting the physical segment number for a mapped segment. So the LSTT has to be included in process' locality list if there is an LSTT. Dispatcher will then bring the LSTT in before the process can be run. Also the bank and address for the LSTT belonging to the current running process are stored in syglob cells (X221 and X222) during the launch time by the dispatcher. These cells are used by microcode for fast accessing the LSTT.

Bind Names Data Segment

The diagram illustrates the structure of a user entry in a database. It is divided into two main sections: a user entry and a volume set entry.

User Entry Structure:

- bind names count
- DST # of bind names segment
- vmask
- pin
- user bind count
- user mount count
- system bind count
- system mount count
- bind names count
- DST # of bind names segment

Volume Set Entry Structure:

- op mask : NVTABX
- a
- v
- a
- i
- l
- a
- b
- l
- e

Labels on the right side of the diagram indicate the sections: "user entry n" for the top section and "volume set entry n (NVTABX = k)" for the bottom section.

G.00.00
12-7

record length (bytes)	data	record length (bytes)
-----------------------------	------	-----------------------------

The diagram shows a disk layout with two sectors, Sector N-1 and Sector N. Each sector contains multiple tracks. Each track contains a sequence of data blocks labeled 'RL' followed by diagonal lines representing data. The diagram illustrates the interleaving of data across sectors and tracks.

The reason for the trailing byte count is to implement an easy way to backspace records.

G.00.00
12-8

End of File Format

Since files always start on a sector boundary, it follows that they also end on one. End of files consist of a 0 record length and 0-fill to the end of the current sector as follows:

In addition, an End-of-File entry is made in the Gap Table, so that files may be skipped by scanning Gap Table entries instead of serially scanning the data area. The Gap Table is described a few pages from now.

G.00.00
12- 9

Contiguous Block Format

A serial disc, if it can do everything a magnetic tape can do, must also be a cold-load device. This means that machine microcode must be able to read a bootstrap channel program and the resident segments of INITIAL from the disc into memory. The microcode and channel programs cannot deal with the record length words which surround standard data records, so for them we have a structure, called a CONTIGUOUS BLOCK, which has the data without the length words. Information as to the length of each contiguous block must therefore be kept elsewhere, so there are Gap Table entries which hold the beginning and ending sector addresses of each contiguous block. This implies that each block must begin and end on a sector boundary. In this way they are similar to data files. To set contiguous blocks off from normal data, and to reach a sector boundary, a record length and fill character = X177777 is used, as follows:

Hole Format

Holes on the serial disc have the same format as contiguous blocks (that is, they start and end on sector boundaries with -1 fill characters as required). Starting with MPE version G.00.00, holes are obsolete and SDISC will not generate them. However, code has been left in SDISC to process any holes found on serial discs written with earlier versions of SDISC. Further details may be found in the Serial Disc INS.

G.00.00
12- 10

Gap Table Format

The Gap Table is a four-word header followed by a series of two-word device address entries. A permanent copy lives on the device, starting in sector 4, while a working copy lives in main memory. The copy in memory is posted to the disc only when a backspace or rewind operation occurs after writing (in other words, when the copy in main memory has changed). The length of the Gap Table is device-dependent according to the table below:

Device	Number of sectors (or ICI blocks)
HP7920	44
HP7925	106
HP7933/35	219
HP7902/9895	26
ICI	4 blocks ("S" cartridge) or 15 blocks ("L" cartridge)

The Gap Table looks like this:

The type field is bits 0, 1 and 2 of the first word. The eight possible types are:

0. End of File. The associated sector address contains one or more end of file fill characters (0) to fill out that sector. In the worst case (the previous record ended exactly at the end of the previous sector), the end of file sector contains all zeros.
1. End of data. The associated sector address is the last address of valid data plus 1, in other words, the next available address. In practice, such an entry is usually preceded by an end-of-file entry, since the EDD entry is written when you stop writing, and the file system will not let you backspace or rewind after writing without sending a Write End of File. An EDD entry is also written at the beginning of the Gap Table when new (unwritten) media is inserted. This prevents erroneous reading of blank media.

G.00.00
12- 11

2. Beginning of Hole. The starting address of a "defective" area of the disc. Usually on a track boundary, but may be in mid-track if a contiguous block was being written when the "defect" was encountered. Obsolete, starting with MPE version G.00.00.
3. End of Hole. The corresponding ending address of the "defective" area. Always at a track boundary. Obsolete, starting with MPE version G.00.00.
4. Beginning of (contiguous) Block. The starting address of a contiguous block, exclusive of the -1 fill characters which may have been required to get us to a sector boundary. Unlike the End of File fill characters, there need not be any -1 characters if the previous record or contiguous block (with or without the trailing length word) ended exactly on a sector boundary.
5. End of (contiguous) Block. The address of the last sector containing contiguous block data. The sector may also contain -1 fill characters to get us to a sector boundary, but as with the beginning of block they are not required if the contiguous block ends exactly on a sector boundary.
6. End of Tape mark. The sector address of the simulated End of Tape reflector. This type is now written only to floppy discs for use by INITIAL's serial disc interface. When read by MPE's SDISC, it will be skipped no matter what device it is found on. This ensures compatibility with older serial discs.
7. End of Gap Table. No associated sector address. If you hit this while scanning the Gap Table, you've gone too far. In practice, this type is created whenever the Gap Table is cleared, by the simple device of initializing the table to -1.

G.00.00
12- 12

SDISC Extra Data Segments

With insignificant exceptions, SDISC operates entirely in split-stack mode, that is, using an extra data segment for its working storage. Starting with MPE version 6.00.00, there are two additional data segments used as no-wait data buffers. For the most part, our discussion here is restricted to the original data segment, now used only for variables, the Gap Table, and data buffer management.

The working storage extra data segment (XDS) is usually acquired by the external procedure ALLOCATE when the serial disc device is first assigned to a user as part of an FOPEN. The external procedure DEALLOCATE makes the XDS go away as part of its processing of the final FCLOSE against the device. The system program PVPRDC may also acquire and release an XDS so that the tape label routines in LRSSEG may also use SDISC for their work when DEVREC processes a device on-line interrupt. SDISC allocates the two data buffer segments as they are needed, then deallocates them as part of the Device Close processing.

In addition to the Gap Table already described, the XDS contains SDISC's global storage area, including the data buffer management areas (BUFFER'INFO), and a small buffer (called WORKTABLE). WORKTABLE holds the contents of the Serial Disc label sector when SDISC reads it in as part of its self-configuration. It also holds the Defective Tracks Table (MAC family discs) or Defective Sector Table (CS80 discs) while reassigning suspect or deleted tracks.

The three arrays in the XDS (WORKTABLE, BUFFER'INFO and GPT (Gap Table)) are all dynamically configured by SDISC as vanilla indirect arrays, such as might have been constructed by SPL. This is done by declaring the array names as pointers, then inserting appropriately computed element-0 addresses in them.

The extra data segment is organized as follows:

0	WORDSPESECTA	These twelve words are reserved for use by ALLOCATE when the data segment is created. However, ALLOCATE only stuffs the last five of them. We fill the first seven ourselves with information we get from the label sector.
1	SECTORSPEATAK	
2	STARTADDRESS (BDT)	
3	EDTSECTA (disc address of simulated end of tape)	
4	EDDSECTA (last sector of disc)	Simulates tape runoff.
5		
6		
7	JUSTALLOCTED	Tells us to initialize SDISC parameters to BDT if true.
8	WRITE RING	Simulation of tape write ring.
9	FATALERROR	Disables SDISC when true.

Length varies with device, and is calculated by SDISC as part of its self-configuration.

12- 14

Serial Disc Organization

The disc is organized as follows:

Label sector	0	See expanded view in Chapter 3.
DTT/DSET	1	DTT (MAC family) or DSET (CS80).
Cold load	2	HP-IB cold load channel prog.
Soft dump	3	SDFTDUMP channel program.
Gap Table	4	to STARTADDRESS - 1.
Data	STARTADDRESS	
	.	
	.	
	to	
	EDTSECTA	
	.	
	to	
	EDDSECTA	
Last data sector		

6.00.00
12- 15

Entry 0

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Number of entries in table															
1	Entry size = 4														
2	DEVREC service request count														
3															

Discussion:

Word 2 is incremented by a device driver whenever it sets the Device Ownership State field (below) to 2 (Service Requested). DEVREC decrements the count for each interrupt it services until the count reaches 0, at which time DEVREC hibernates.

-- CRUTION --

Device drivers must lock this table by DIS-
RABLE/ENABLEing, -NDT- by trying to acquire
the LPDT SIR.

Typical Entry (Virtual Devices)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Pointer to XDD subentry															
1															
2															
3															

ID -- 0 for input, 1 for output.

Word 0, bit 0 is 1 for a virtual device, 0 for a real device. The fields in word 1 are the same, as applicable, as for the real device represented by a given virtual device. See below.

6.00.00
13- 5

Typical Entry (All Real Devices)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Devc J Da D I End of Ru: Device															
1	Duned o ta u n File to: Subtype														
2	State b p t Cndition														
3	SYSDB-relative pointer to the DIT														

Discussion:

Word 1.(0:2) -- Device Ownership State:

- 0 -- Not owned by any process.
- 1 -- Owned by a process.
- 2 -- Service requested. Set by driver for unexpected interrupt, then makes DEV-REC.
- 3 -- Service granted. Set by DEVREC. Logon sequence is 0-2-3-1.
- 3 -- Device reserved (alternate use). Set during STARTSPool, spooler process sets to 1 when it gets started.

Word 1.(2:1) -- Device is Job/Session Accepting if true.

Word 1.(3:1) -- Device is Data Accepting if true.

Word 1.(5:1) -- Device is Duplicative if true (all devices except discs).

Word 1.(6:1) -- Device is Interactive if true (all devices except discs).

Word 1.(7:3) -- End of File condition:

- 0 -- No EOF detected.
- 1 -- Hardware EOF (e.g., tape mark).
- 2 -- :DATA record read.
- 3 -- :EOD record read.
- 4 -- :HELLO record read.
- 5 -- :BYE record read.
- 6 -- :JOB record read.
- 7 -- :EOL record read.

Word 1.(12:4) -- Device subtype. See discussion for tape entry (below) for a description of the Auto bit (12:1).

The remaining bits in Word 1 are device-dependent and are described with their corresponding entry diagram.

6.00.00
13- 6

Entry for Terminal-Like Devices

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Devc J Da Ct D I End of B L Device															
1	Duned o ta Y u n File r o Subtype														
2	State b p t Cndition k g														
3	SYSDB-relative pointer to the DIT														

Discussion (unique fields only):

Word 1.(4:1) -- CONTRL-Y is allowed and has been detected.

Word 1.(10:1) -- BREAK has been detected -OR- ignore BREAK if the C.I. is running.

Word 1.(11:1) -- The terminal is logging on. This bit is set by PROGEN and DEVREC when the logon sequence starts. If the bit is off when polled by INITIUMP, the terminal has disconnected. For now, only IDTERM and HIDTERM support the use of this bit. Multipoint and DS pseudo-terminals do not.

Entry for Tape Drives

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Devc J Da B D I End of A Ru: Device															
1	Duned o ta O u n File V to: Subtype														
2	State b T p t Cndition R :														
3	SYSDB-relative pointer to the DIT														

Discussion (unique fields only):

Word 1.(4:1) -- BDT. Tape is at Load Point -DR- no tape mounted. Recording density may only be switched when this bit is true (for multiple density tape drives).

Word 1.(11:1) -- If true, DEVREC is performing Automatic Volume Recognition (AVR) on a tape (or PVPROC is doing the same on a serial disc). -DR- AVR is to be suppressed on job or data accept- ing devices.

6.00.00
13- 7

Word 1.(12:1) -- Part of Device Subtype field. If true, device is allocated automatically when opened. If false, operator must allocate.

Entry for Disc Drives

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Devc J Da N Mt RV End of S F Device															
1	Duned o ta S d File or o Subtype														
2	State b D PV Cndition F r														
3	SYSDB-relative pointer to the DIT														

Discussion (unique fields only):

Word 1.(0:2) -- Device Ownership State. May not be 1 (owned) for shared device (system volume or private volume). Serial and foreign discs are non-sharable and may be owned. See the full discussion of this field under Typical Entry, above.

Word 1.(4:1) -- If true, the disc is a nonsystem domain (private volume, serial disc or foreign disc) disc drive.

Word 1.(5:1) -- If true, disc is a mounted private volume.

Word 1.(6:1) -- If true, the disc is a reserved volume used to satisfy the requirements of a multiple volume private volume set.

Word 1.(10:1) -- If true, the disc is a physically and logically mounted serial or foreign disc. Bits 5 and 6 must be false.

Word 1.(11:1) -- If bit 10 is true, then 1 ==> foreign disc, 0 ==> serial disc.

Word 3.(1:1) -- If true, the device is currently being used as a serial disc (that is, it is allocated to a user as a serial disc). This bit duplicates a bit in the LDTX entry so that this information can be found in a system (memory-resident) table.

5	Number of devices in class (N)															
6	LDEV #1															
7	LDEV #2															
N+5	LDEV # N															

Discussion:

The Device Class Table (DCT) contains a varying number of variable length entries. This is because you may configure an arbitrary number of device classes on a system, and each device class may be comprised of an arbitrary number of logical devices. There is one DCT entry per device class, and each DCT entry contains a list of logical devices in the class. There is no established order of entries in the DCT, nor is there an order of LDEVs within an entry.

Due to the haphazard nature of the DCT, its overall properties are kept in the header entry. These include the segment-relative starting address of the DCT (in case the header entry should be expanded later) and the number of entries in the table. It is segment-relative pointing to the Terminal Descriptor block, which follows the DCT) may also be used to calculate the size of the DCT. Also note the "Entry size" word. It is meaningless for this table, but is included for compatibility with other fixed-length entry NPE tables. Since the DCT entries are of variable length, when you want a particular entry you must always start at the beginning of the DCT and link through each entry until you find the one you're interested in.

A few of the fields in the DCT require further description:

Word 4.(1:7) -- Cyclical pointer. Currently used only for system and private volume disc devices. The pointer varies from 1 to N (number of en-

G.00.00
13-16

I / D

tries in the class) and indicates the LDEVH in the class list on which the last extent was allocated. The disc space allocation routines will try to satisfy the next re-quest on the next disc drive indicated by the cyclical pointer (with wraparound to 1 if the pointer > N). If that fails, the pointer is incremented until space is found or all devices in the class have been tried.

Word 4.(8:1) -- If set, spooling has been enabled (spool queues opened) for this device class.

Word 4.(9:1) -- If set, the class is a terminal type class.

Word 4.(10:6) -- Usually the same as the device type represented sented by the class (0 for24 for tape, 32 for printer, etc.). Serial disc classes are disc devices accessed as tape drives, so their true device types are kept in the LDT, while this field holds a special cial type (31, or X37), indicating a serial I/O (non-concurrent) device. Similarly, a foreign disc is a nonsharable disc drive, so that fact is reflected by a special type 7 in this field, even though the true hard-ware type is kept in the LDT, as for serial discs.

G.00.00
13- 18

I / D

ILT (Cont.)

ICPVAR - These four words comprise the channel program variable area where information is stored concerning a channel program Interrupt instruction or abort. CPVAR0 should be used only for channel program aborts.

ICPVAR4 - Words 4 and 5 contain DMA address, when channel program aborts during DMA transfer.

ISRQL - Serial poll request queue length. HP-IB Systems do not support any serial poll devices. This should always be zero.

ICPGM - This is the SYSDB relative address of the channel program to be started for this device after receiving a MIDP interrupt in GIP. GIP will call STARTID when the flags word indicates "ignore halt interrupt" and "start channel program" bits are set.

ICNTRL - Contains controller information.

.M If set, the controller is sharing a software channel resource in order to limit bandwidth.

.CHMQ The software channel resource number.

.DRTN The DRT number for a Series 33 device is equivalent to:
.CHAN - channel number (4 most significant bits of DRTN)
.DEV - device number (3 least significant bits of DRTN)

IFLAG - Used for controller flags.

.RW Runwait flag. An idle channel program should be started when there are no active requests to process.

.WP Waitprog flag. An idle channel program has been started for this controller. This bit is reset by an interrupt.

.IG Ignorehi flag. An MIDP instruction has been issued against this controller, but the channel program was not in a wait statement. Therefore, ignore the interrupt generated by the channel code when this program halts.

.SC Start channel program flag. When set along with the IG flag, GIP will start a previously attempted SIDP on this device.

.SQ Start channel program "queued" flag. When bit SC is set, this bit will determine if the call to START MP-IB will have logical parameter QUEUED true or false.

.HCUNIT Highest configured unit number for this controller.

G.00.00
13- 19

I / D

Device Information Table (DIT)

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the I/O queue element. Although details of DIT's vary with device, the following structure is common to all:

DIT for HP-IB Systems

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
0	IT	ID	AC	RQ	SI	MI	0	ID	IR	NO	ST	HS	STATE				DFLAG
1	[SYSDB relative pointer to the DIT for the next device requesting this resource or service]																DLINK
2	[SYSDB relative pointer to the first IDQ in request list for this device]																DIDQP
3	Logical device number																DLDEV
4	[SYSDB relative pointer to Device Linkage Table]																DDLTP
5	[SYSDB relative pnter to Interrupt Linkage Table]																DILTTP
6	Controller Hardware Status																DSTAT
7	Hardware error status. Set when the driver detects an error. Whenever <X>, the driver monitor logs an I/O error and clears this word																DSERR
8	Device Dependent Area																(DTIME)
9	Device Dependent Area																(DTRQX)
10	IOT										///////////////// Phys. unit H						DUNIT

DTRCX Used by some device drivers, it denotes timer request index.

DIT Terminology for HP-IB Systems

DFLAG - DEVICE RELATIVE FLAGS
 T SET IF DEVICE IS A TERMINAL.
 D SET IF DEVICE IS A DISC.
 AC ACTIVE BIT. 1 IMPLIES A MONITOR CURRENTLY SERVICING THIS DEVICE.
 RQ REQUEST BIT. 1 IMPLIES SERVICE REQUESTED WHILE MONITOR IS ACTIVE.
 MU IF SET, MULTIPLE UNIT CONTROLLER.
 IO IF SET, THEN A CHANNEL PROGRAM IS CURRENTLY EXECUTING.
 IR IF SET, AN INTERRUPT OR RESPONSE HAS OCCURRED.
 MD IF SET, DEVICE IS IN A NOT READY OR OPERATOR WAIT.
 ST IF SET, AN IDLE CHANNEL PROGRAM SHOULD BE STARTED FOR THIS DEVICE.
 SI SPECIAL INTERRUPT HANDLER
 NS DO NOT SHORT WAIT THIS DISC
 STATE CURRENT DRIVER STATE AS DEFINED BY THE MONITOR.
 ALLOWABLE STATES ARE:
 0 - START REQUEST
 1 - NOT USED (BUT RESERVED)
 2 - CALL DRIVER INITIATOR
 3 - CALL DRIVER COMPLETOR
 4 - NOT USED (BUT RESERVED)
 5 - COMPLETE REQUEST
 6 - UNEXPECTED INTERRUPT OCCURRED
 7 - START OPERATOR INTERVENTION WAIT
 X10 - WAITING (ON OPERATOR). RESTART AT 0
 X11 - WAITING (DATA MAKEPRESENT/FREEZING)
 X12 - WAITING (INITIATOR CODE MAKEPRESENT/FREEZE)
 X13 - WAITING (FOR COMPLETION INTERRUPT)
 X14 - WAITING (FOR DEVICE CONTROLLER AVAILABILITY)
 X15 - NOT USED (BUT RESERVED)
 X16 - WAITING (INITIATOR CODE MAKEPRESENT)
 X17 - WAITING (COMPLETOR CODE MAKEPRESENT)
 IDT - I/O System type 0-Series II/III I/O System
 1-HP-IB Systems
 2-unused
 3-unused

Device Information Table (DIT) for CIPER

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IDQ element (however, this driver only supports one device per controller.) The following diagram shows the DIT used for the HP-IB CIPER physical driver.

G.00.00
13- 21

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MEMORIC

3	IDT	Phys. unit # Logical device number																	DLDEV	
4	SYSDB relative pointer to Device Linkage Table																		DOLTP	
5	SYSDB relative pointer to Intrp Linkage Table																		DILTTP	
6	VS	AB	RE	ITP	NR	NR CNT DEVICE STATUS													DSAVE	
7	Hardware error status. Set when the driver detects an error. Whenever <0, the driver monitor logs an I/O error and clears this word																		DSERR	
X10	Bit 0 is set at completion of timer																		DTIME	
X11	Holds the time out request entry index while a timer is active.																		DADST	
X12	RF	UE	DE	TD	UNIT CNT	DATA CNT	TD CNT	PRTY CNT											DCOUNTS	
X13	Error logging location #1																		DLOGERRDR	
X14	Error logging location #2																		DLOGCOUNT	

DFLAG - Flags and request state
 AC ACTIVE - A monitor is currently servicing this device.
 RD REQUEST - A service request is pending while the monitor is active.
 ID IDPRDG - An I/O Channel Program is running for this device.
 IR IAK - An interrupt or response has occurred for this device.
 MD NOTRDY - Go to state X10 after Idle Channel Program is started.
 ST STWRIT - The device monitor is starting an Idle Channel Program for this device. There is no IDQ associated with this type of request.
 STATE - State of the device monitor. Specifies the next action to be taken in SIODM in servicing the request:
 0 - start new request
 1 - not used
 2 - call driver initiator procedure
 3 - call driver completor procedure
 4 - not used
 5 - process request completed
 6 - initiate device recognition sequence
 7 - start operator intervention wait

G.00.00
13- 22

X10 - wait for interrupt (operator intervention) restart at state 0
 X11 - wait for data segment freeze, then state 2
 X12 - wait for driver initiator to be frozen, then allocate controller (state 2)
 X13 - wait for I/O completion interrupt, then state 3
 X14 - wait for controller, then call driver initiator
 X15 - not used
 X16 - wait for initiator make present, then state 2
 X17 - wait for completor make present, then state 3

DLDEV - I/O system type, unit and logical device number
 0 - HP3000 Series II/III
 1 - HP 3000 HP-IB
 2 - Unused
 3 - Unused

DSAVE - Device processing flags
 VS - VALID STATUS - Set to indicate Device Status has been updated.
 AB - DVARFLAG - Sequence Abort in progress due to ABDRT request.
 RE - RETRYFLAG - Sequence Abort in progress due to an error.
 TP - TIMERRPDPED - Current error is due to software timer popping.
 NR - NOTRDYFLAG - Not Ready Wait in progress.
 NR CNT - Number of Not Ready Waits during this request.
 DEVICE STATUS - Device status returned during a Sequence Abort.
 BIT 8 - CAC available and enabled.
 " 9 - Reserved.
 " 10 - Reserved.
 " 11 - Reserved.
 " 12 - Power fail or reset has occurred.
 " 13 - A protocol error has been detected.
 " 14 - A parity error has been detected.
 " 15 - The peripheral has data to send.

DSERR - Pointer to status to be logged.
 Bits(0:8) - Number of words to be logged.
 Bits(8:8) - Offset relative to DITP(0).

DCOUNTS - Error flags and error counts (4).
 RF - RED FAILED - An error has forced this request to be aborted.
 UE - UNIT ERROR - The current error is a Unit Error.
 DE - DATA ERROR - The current error is a Data Error.
 TD - TIME OUT - The current error is a GIC Time Out Error.
 UNIT CNT - Number of Unit Errors during this request.
 DATA CNT - Number of Data Errors during this request.
 TD CNT - Number of GIC Time Outs during this request.
 PRTY CNT - Number of HP-IB Parity Errors during this request.

G.00.00
13- 23

DIT for Channel Devices

	D	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

1	NEXT DITP																DLINK
2	IDQP																DIQDP
3	LOGICAL DEVICE NUMBER																DLDEV
4	DLTP																DOLT
5	ILTTP																DILTTP
6	Controller Hardware Status																DSTAT
7	Hardware Error Status																DSERR
8																	DTIME
9																	DTRQX
10	IDT												PHYS. UNIT #	DUNIT			
	DRIVER DEPENDENT DIT AREA																

DFLAG. TERMINAL - Device is a terminal
 .DISC - Device is a Disc (Bit 0 = 0)
 .ACTIVE - A monitor is currently servicing this device
 .REQUEST - Service requested while monitor was active
 .MUNIT - device controller servicing multiple units
 .SIDPREMPT - If set then a request has been queued for this device. Preempt code is set in IDQ.
 .IDPRDG - I/O program in progress. Decrement SIOCOUNT and check for multi-channel when complete
 .IAK - Interrupt or Response has occurred.
 .M HEAD - Moving head disc
 .NOT RDY - Not ready for SID. SIODM holds off next SID until ALLDAPDLL is done.

DTRQX - Used by some device drivers, it denotes timer request index.

G.00.00
13- 24

I / 0

DIT for Channel Devices (Cont.)

DFLAG.STATE - this quantity specifies the next action to be taken in servicing the request.

- 0-new - start request.
- 1-not used.
- 2-call Driver Initiator Procedure
- 3-call Driver Completor Procedure
- 5-complete request
- 6-device recognition
- 7-start operator intervention wait (X10)
- Z10-restart request on interrupt
- Z11-wait for data to be frozen then state 2
- Z12-wait for driver code to be frozen then state 2
- Z13-call completor on interrupt
- Z14-wait for device controller
- Z15-not used
- Z16-wait for initiator make present then state 2
- Z17-wait for completor make present then state 3

DLINK - SYSDB relative pointer to the DIT for the next device requesting this resource or service.

DIQDP - SYSDB relative pointer to the first IDQ in the request list for this device

DLDEV.LDEVN - Logical Device Number

.UNIT - unit number of the physical device.

.IDT - ID type 0 => Series III I/O, 1 => NP1B I/O

DDLTP - SYSDB relative pointer to the DLT.

OILTP - SYSDB relative pointer to the ILT.

OSTAT - interrupt status for this device. Set each time the device interrupts.

OSEAR - Hardware Device Controller Status. Set when the driver detects an error. Whenever not zero, SIODB logs an I/O error and clears this word.

DTIME - time out completed flags. If a timeout occurs in response to a timer request type X20 (I/O request), the sign bit is set in this word. The IA bit in DFLAG is also set, and the monitor for this device is awakened. (Only used if timer services are requested. Must be word #8 if timer services are requested.)

DFLAG - Flags and request state

TH TERM - Set if device is a terminal. OS DISC - If TH = 0 and this bit is set then the device is a disc, otherwise device dependent. RC ACTIVE - R monitor is currently servicing this device. RQ REQUEST - R service request is pending while the monitor is active. IO IOPROG - Rn I/O Channel Program is running for this device. IR IRK - Rn interrupt or response has occurred for this device. HO NOTROY - Go to state X10 after Idle Channel Program is started. ST STURIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request. STATE - State of the device monitor. Specifies the next action to be taken in SIOBH in servicing the request:

0 - start new request 1 - not used 2 - call driver initiator procedure 3 - call driver completor procedure 4 - not used 5 - process request completed 6 - initiate device recognition sequence 7 - start operator intervention wait X10 - wait for interrupt (operator intervention) restart at state 0 X11 - wait for data segment freeze, then state 2 X12 - wait for driver initiator to be frozen, then allocate controller (state 2) X13 - wait for I/O completion interrupt, then state 3 X14 - wait for controller, then call driver initiator X15 - not used X16 - wait for initiator make present, then state 2 X17 - wait for completor make present, then state 3

DLINK - R SYSDB relative pointer to the next OIT requesting this resource or service.

DCURREQP - R current request sysbase index.

DUNIT.(0:2) - I/O system type

0 - non-HP-IB 1 - HP3000 HP-IB Systems 2 - Unused 3 - Unused

DLDEV - Logical device number of this device.

DSTRT - Set to a -1 when a system powerfail has occurred.

DSERR - Pointer to status to be logged.

Bits(0:7) - Number of words to be logged. Bits(8:15) - Offset relative to DITP(0).

DNISC - Device dependent processing flags

LOCK*FLG - Lock flag denoting unload status of the disc volume.

0 - Rllow operator unload to the volume. 1 - Deny operator unload to the volume.

G.00.00
13- 30

IGNORE*INT*FLG - Ignore unexpected interrupt flag.

SUBSTRTE - Indicates state of the idle channel program:

0 - Normal idle channel program wait 1 - Idle request being serviced wait

DSBUFDDOR - SYSDB relative pointer to the system buffer element used to read the DSCT. Zero, if no element gotten.

DBRDLK1 - High order logical sector address of the bad block for the Defective Sector Table (DSCT) entry.

DBRDLK2 - Low order logical sector address of the bad block for the DSCT entry.

DBRDNFER - Byte transfer left when bad block occurred.

DLOGERROR - CPVR(0) logged on hardware error status.

DSIOPTOP - Stopped channel program relative offset location due to an error in CPVR(0).

DSTRTUS - 20 bytes disc status logged on status error. (See CS'80 Disc Drive Status).

RPSWORO1 - Flags and local state

RE - Read revision code done. Set if read revision code level is done. DC - RPS revision code. Set if controller is "PEP"ed. DR - RPS desirable. Set if RPS is desirable. EN - RPS enabled. Set if default value for RPS is enabled. NR - Driver is processing a marginal data error from the drive. Do not return hard error. Local State - State of the local request made by driver

0 - No local request is being processed 1 - Reading rev code 2 - Setting default RPS

RPSWORO2 - Default value for RPS

T1 - Time to target in hundreds of microseconds T2 - Window size in hundreds of microseconds

G.00.00
13- 31

DIT for 7976 Magnetic Tape

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IOQ element. The following diagram shows the DIT used for the mag tape driver.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC	
0	0	0	RC	IR	Q	0	MU	0	IO	IR	0	0	0	0	0	0	STRT	DFLAG
1	SYSOB relative pointer to the DIT for the next device requesting this resource or service																DLINK	
2	SYSOB relative pointer to the first IOQ in request list for this device																OIOQP	
3	Logical device number																DLDEV	
4	SYSOB relative pointer to Device Linkage Table																DOILTP	
5	SYSOB relative pntnr to Interrupt Linkage Table																OILTP	
6	RW	RW	RW	SH					DC	PF							DSRYE	
7	Hardware error status. Set when the driver detects an error. Whenever <X>, the driver monitor logs an I/O error and clears this word																DSEAR	
X10	Bit 0 is set at completion of timer																DTIME	
X11	Interrupt status for this unit. Set by the driver each time it processes an interrupt.																DSTRT	
X12	IDT Physical unit #																	
X13	Holds the time out request entry index while a timer is active.																ORQST	
X14	Error log. Contains 5 valid bytes of status																OLDGERRR	

DFLAG - Flags and request state

RC ACTIVE - R monitor is currently servicing this device.
 RO REQUEST - A service request is pending while the monitor is active.
 MU MUNIT - This device is on a multi-unit controller.
 IO IOPROG - Rn I/O Channel Program is running for this device.
 IR IRK - Rn interrupt or response has occurred for this device.
 NO NOTRDY - Go to state X10 after Idle Channel Program is started.
 ST STWRIT - The device monitor is starting an Idle Channel Program for this device. There is no IOQ associated with this type of request.

G.00.00
 13- 34

STATE - State of the device monitor. Specifies the next action to be taken in SIOQM in servicing the request:

- 0 - start new request
- 1 - not used
- 2 - call driver initiator procedure
- 3 - call driver completor procedure
- 4 - not used
- 5 - process request completed
- 6 - initiate device recognition sequence
- 7 - start operator intervention wait
- X10 - wait for interrupt (operator intervention) restart at state 0
- X11 - wait for data segment freeze, then state 2
- X12 - wait for driver initiator to be frozen, then allocate controller (state 2)
- X13 - wait for I/O completion interrupt, then state 3
- X14 - wait for controller, then call driver initiator
- X15 - not used
- X16 - wait for initiator make present, then state 2
- X17 - wait for completor make present, then state 3

DSRYE - Device processing flags

RW RUBIT - Indicates tape has been rewound.
 RU RWUNLD - Indicates that a rewind/unload was performed to allow a write-ring mount.
 SH SHORT - A short read is in progress. After completion of read, EOF is checked for and if not present, the requested bytes are transferred from the short-read buffer to the user's buffer.

DC DSFLAG - Transfer used data chaining - used for computing the transmission log.
 PF POWER - Device power up indication.

G.00.00

Card Reader DIT Field Definitions

DFLAG - Flags and device state

ACTIVE Monitor is currently active servicing this device.
 REQUEST Service for this device was requested while the monitor was active.
 IOPROG SIO program in progress.
 IRK Interrupt occurred or request aborted or preempted.
 READDONE Previous read resulted in an EOF with a backup save requested. The data has been saved in an auxiliary buffer and will be passed back on the next read request.
 NRMESSAGE Set when a not ready message has been issued, and cleared when the reader is found ready. Used to prevent multiple Not Ready messages when power is turned on.
 NSTATE Monitor State. See SIOBN specifications for details.
 DLINK - SYSDB relative pointer to the DIT for the next device requesting service for this resource.
 DIIDDP - SYSDB relative pointer to the first IDD element in the request list for this device.

DLDEV - Logical device number and unit number.

UNIT Unit number of device.

LDEVN Logical device number.

OOLTP - SYSDB relative pointer to driver linkage table (DLT).

DSTAT - Device interrupt status. Contains the device interrupt status at the last interrupt. See hardware ERS for details.
 DSERR - Device interrupt error status. If not zero, then holds the device interrupt status from an operation with an erroneous completion status. Causes SIOBN to log an error.

DWCNT - Holds the requested transfer count in words.

 G.00.00
 13- 38
Device Information Table for HP-IB Card Reader

There is one OIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IDD element. The following diagram shows the OIT used for the card reader driver.

	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	PHONOMIC

DFLAG - Flags and request state
 AC ACTIVE - R monitor is currently servicing this device.
 RD REQUEST - R service request is pending while the monitor is active.
 MU MUNIT - This device is on a multi-unit controller.
 ID IDPROG - Rn I/O Channel Program is running for this device.
 IR IRK - Rn interrupt or response has occurred for this device.
 ND NOTRDY - Go to state X10 after Idle Channel Program is started.
 ST STATE - The device monitor is starting an Idle Channel Program for this device. There is no IDD associated with this type of request.

 G.00.00
 13- 39

STATE - State of the device monitor. Specifies the next action to be taken in SIOBN in servicing the request:
 0 - start new request
 1 - not used
 2 - call driver initiator procedure
 3 - call driver completor procedure
 4 - not used
 5 - process request completed
 6 - initiate device recognition sequence
 7 - start operator intervention wait
 X10 - wait for interrupt (operator intervention) restart at state 0
 X11 - wait for data segment freeze, then state 2
 X12 - wait for driver initiator to be frozen, then allocate controller (state 2)
 X13 - wait for I/O completion interrupt, then state 3
 X14 - wait for controller, then call driver initiator
 X15 - not used
 X16 - wait for initiator nake present, then state 2
 X17 - wait for completor nake present, then state 3

DLDEV - Device logical device number

IDT I/O TYPE - I/O System type
 0 = Series II / III I/O system
 1 = HP-IB Systems
 2 = unused
 3 = unused

DSAVE - Device processing flags

RD READDONE - A card has already been read.
 AF ABORTFLAG - A device clear has already been sent for this series of aborted IDDs.

 G.00.00
 13- 40

2608 Line Printer DIT (NP-IB Systems)

There is one DIT per physical device. If a physical device represents more than one logical device, the logical device number is obtained from the IDQ element (however, there is only one device per 2608 controller.) The following diagram shows the DIT used for the 2608 line printer driver.

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC

X13																DLOGERRDR

DFLAG - Flags and request state

RC ACTIVE - R monitor is currently servicing this device.
 RQ REQUEST - R service request is pending while the monitor is active.
 ID IDPROG - Rn I/O Channel Program is running for this device.
 IR IRK - Rn interrupt or response has occurred for this device.
 ND NOTRDY - Go to state X10 after Idle Channel Program is started.
 ST STWRIT - The device monitor is starting an Idle Channel Program for this device. There is no IDQ associated with this type of request.

G.00.00
13- 41

STRTE - State of the device monitor. Specifies the next action to be taken in SIDDM in servicing the request:
 0 - start new request
 1 - not used
 2 - call driver initiator procedure
 3 - call driver completor procedure
 4 - not used
 5 - process request completed
 6 - initiate device recognition sequence
 7 - start operator intervention wait
 X10 - wait for interrupt (operator intervention) restart at state 0
 X11 - wait for data segment freeze, then state 2
 X12 - wait for driver initiator to be frozen, then allocate controller (state 2)
 X13 - wait for I/O completion interrupt, then state 3
 X14 - wait for controller, then call driver initiator
 X15 - not used
 X16 - wait for initiator make present, then state 2
 X17 - wait for completor make present, then state 3

DLDEV - I/O system type, unit and logical device number

IDT I/O TYPE - Type of I/O system

0 - HP3000 Series II/III
 1 - HP3000 NP-IB Systems
 2 - unused
 3 - unused

DSAVE - Device processing flags

VM VFCMOD - VFC has been modified.
 TRB TABDFRULT - System tab default.
 PS PRESPRICE - Last request used prespacing.
 FL FULL - Line printer buffer is full.
 TP TOP - Printer is at top of form

15	!	!	!	!	!	!	!	!	!	!	!	!	!	!	!	!

WORD 0 - EACH BIT IS THE 'DR' OF ONE WORD IN THE TABLE (EXCEPT BIT 0 WHICH IS NOT USED). THEREFORE, BIT (1:1) IS SET IF WORD 1 IN THE TABLE IS NON-ZERO.

WORD 1 - BIT= 0 - (DF) OFFLINE/OFFLINE BIT.
 1 - (HS) MESSAGE BEING DISPLAYED ON THE 2680R/2688R CONSOLE.
 2 - (PU) POWER UP COMPLETED SINCE LAST I/O STATUS READ.
 3 - (PE) PRETTY ERROR DETECTED ON PWT COMMAND.
 4 - (TE) TRANSMISSION ERROR DETECTED IN THE PRINTER.
 5/15 - RESERVED. UNUSED.

WORD 2 - NOT USED. RESERVED.

WORD 3 - MCS FAULT NUMBER. CONTAINS AN INTEGER DESCRIBING THE LAST FAULT TO OCCUR SINCE THE LAST TIME THE I/O STATUS WAS READ OR THE HP 2680R/2688R WAS POWERED DOWN. IF THE WORD IS ZERO THERE

G.00.00
 13- 48

IS HD MCS FAULT. SEE OCS ERS FOR A DESCRIPTION OF THE MCS FAULT NUMBERS.

- WORD 4 - BIT= D - (CL) HD ROOM FOR ATTEMPTED CHARACTER SET LOAD.
 1 - (FL) HD ROOM FOR ATTEMPTED FORM LOAD.
 2 - (VL) HD ROOM FOR ATTEMPTED VFC LOAD.
 3 - (CU) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY SELECTED CHARACTER SET.
 4 - (FU) ATTEMPT TO SELECT AN UNDEFINED FORM SET.
 5 - (VU) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY SELECTED VFC SET.
 6 - (IL) ATTEMPT TO PRINT DATA AND THERE IS NO CURRENTLY SELECTED LOGICAL PAGE TABLE (LPT) ENTRY.
 7 - (IP) ATTEMPT TO MOVE PEN OFF THE LOGICAL PAGE.
 8 - (ST) THE 2680R/2688R COULD NOT PROCESS ALL OF THE DATA BEFORE IT WAS SUPPOSED TO BE TRANSFERRED TO THE DRUM/PAPER. DATA WAS LOST!
 9 - (SB) SPOOLER BLOCK CONTAINS FORMAT ERROR.
 10 - (IR) INVALID RECOVERY BLOCK RECEIVED FROM SPOOLER.
 11 - (NP) MAXIMUM NUMBER OF COPIES PER PHYSICAL PAGE HAS BEEN EXCEEDED. THIS IS A RESULT OF THE SPOOLER PROCESS SETTING THE MAXIMUM COPIES PER PAGE WITH FUNCTION CODE 132.
 12 - (NJ) A COMMAND OR FUNCTION CODE WAS RECEIVED WHEN NO "JOB" WAS IN PROGRESS. THE COMMAND OR FUNCTION WAS IGNORED BY THE OCS.
 13 - (NM) NO MEMORY. 2680R/2688R DYNAMIC MEMORY ALLOCATION HAS DETECTED THAT MAIN MEMORY IS COMPLETELY OCCUPIED WITH CHARACTER SETS, VFC'S, FORMS AND DATA SUCH THAT THE 2680R/2688R CANNOT PROCESS THE CURRENT INPUT DATA. DATA WILL BE LOST!
 14 - (TL) ATTEMPT TO PRINT DATA AND THERE ARE MORE THAN THE MAXIMUM ALLOWABLE LOGICAL PAGE TABLE (LPT) ENTRIES SELECTED.
 15 - (NC) A NON-EXISTENT VFC CHANNEL WAS SKIPPED TO.
- WORD 5 - BIT= D - (LP) LOGICAL PAGE TRUNCATED TO FIT PHYSICAL PAGE.
 1 - (PF) PAGE SIZE REQUIRED BY PROGRAMMER DID NOT MATCH PAGE SIZE SET BY OPERATOR. OPERATOR PAGE SIZE PREVAILS.
 2 - (NC) NO CHARACTER SET SELECTED.

WORDS 6/11 NOT USED BUT RESERVED FOR FUTURE USE.

WORDS 12/13 - THE RECORD NUMBER WHICH CONTAINS THE OFFENDING ERROR AS DEFINED BY WORD FOUR. IF A POWER FAIL OCCURS DURING A "JOB", THE POWER FAIL BIT IS SET AND A SHEET NUMBER IS MADE AVAILABLE IN WORDS FOURTEEN AND FIFTEEN. HOWEVER, THE RECORD NUMBER IS LOST AND CANNOT BE REPORTED. THESE WORDS OCCUR IN A "JOB" ONLY.

WORDS 14/15 - THE SHEET NUMBER ON WHICH THE ERROR OCCURRED AS DEFINED BY WORD FOUR. IF AN ERROR OCCURS IN THE ENVIRONMENT FILE AT THE START OF A "JOB", THEN THIS NUMBER WILL BE ZERO.

G.00.00
13- 49

IN ADDITION, WHEN A POWER FAIL OCCURS DURING A "JOB", THE POWER ON BIT IS SET IN WORD ONE AND THE SHEET NUMBER OF THE LAST SUCCESSFULLY TRANSFERRED PAGE IS PLACED HERE. THIS INFORMATION IS FOR USE BY THE SPOOLER SHOULD A RECOVERY OF A "JOB" BE DETERMINED. THESE WORDS OCCUR IN "JOB" ONLY.

ALL WORDS OF THE I/O STATUS ARE CLEARED WHENEVER THE STATUS BLOCK IS RETURNED TO THE HOST. IT IS UP TO THE HOST CPU TO RETAIN ANY ONGOING STATUS BITS REQUIRED.

Disc Request Table and Disc Requests

Requests for disc transfers are effected by acquiring an entry from the Disc Request Table (DISCREQTAB), filling the proper information, and calling the DISCOMANRGR to link the request into the device's doubly linked request queue. The head and tail of a device's request queue are contained in the device's DIT.

3	DATA SEGMENT OST NUMBER														QMISC
4	ADDRESS														QDSTN S(Word 4(0:1) StackFlag If set QADDR is DB rel.
5	UNIT FUNCTION														QADDR
6	COUNT/XLOG/CONTROL RETURNS														QFUNC
7	P1														QMBCT
8	P2														QPARR1
9	QUALIFIER STATUS														QPARR2
10	PCBN														QSTAT
11	PCBN														QPCBN

QFLAG - Request dependent flags

Bit 0	.ABORT	Request has been aborted externally.
Bit 1	.SPECIAL	Special handling is to be applied to this request. For disc, indicates a memory management request.
Bit 2	.DIAG	Diagnostic request (not used).
Bit 3	.SBUF	System Buffer. Target is a system buffer whose index is relative to the start of the SBUF table.
Bit 4	.IOWAKE	Wake caller on completion of request.
Bit 5	.BLOCKED	Blocked I/O. Caller is waited in ATTACHIO until request is completed.
Bit 6	.COMPLETED	Request has been completed and caller woken if he had specified.

G.00.00
13- 58

I / O

I/O Queue Element (Cont.)

Bit 7	.DATAFAZN	Data segment has been made present and is frozen.
Bit 8	.MANERRORD	MAN error on data segment make present.
Bit 9	.PREQ	This request has been started but was preempted by a MAN request.
Bit 10	.SFAIL	Start SIO failure in GIP.
Bit 11	.PFAIL	The I/O has been aborted because of a powerfail.
Bits 12-13	.PREEMPT	Preemptive type code: 1-soft, 2-hard.
Bit 15	.MSGDONE	A message request reply has completed.
QLINK	Table relative index of next IOQ element. Points to first word of element.	
QLDEV	Logical Device Number	
QMISC	Device dependent.	
QDSTN	If SYSBUFAs is clear then this is the OST number of the target data segment. If bit 0 is set then buffer address is a DB offset value instead of segment relative offset (implemented for NOWAIT ID and NOSUFF).	
QADDR	Offset in data segment or sys buff table to target data buffer.	
QFUNC.FUNC	Function code and qualifiers as specified by driver.	
QMBCT	On initiation specifies the word count if positive or byte count if negative. At completion of the request this location contains the actual transmission count in the same units as the call. Certain control requests return data through this location.	
QPARR1	Parameter one, defined by driver	
QPARR2	Parameter two, defined by driver	
QMISC	Miscellaneous request dependent storage available to driver.	
QPCBN	PCB Number of process which made this request. Zero if not associated with any process and IOQ is to be returned by the system.	
.QUALIFIER	A code which further defines or qualifies the general status. Defined by driver.	
.STATUS	General Status. Indicates current and result state of the request according to the following codes. 0 - not started or awaiting completion. 1 - successful completion. 2 - end of file detected. 3 - unusual condition. 4 - irrecoverable error.	

Word 11 bit 0- Queue element is on free list.

QFLAG - Request dependent flags

Bit 0 ABORT - Abort this request and return an error indication to the caller.

Bit 1 SPECIAL - Apply special handling to this request. (Not used)
Bit 2 DIAG - This is a request from the diagnostic subsystem. (Not used)

Bit 3 SYSBUFF - Target is an index relative to the SBUF Table of the data buffer.

Bit 4 IOWAKE - Wake caller on completion of request.

Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTACHIO

G.00.00
13- 62

- Bit 6 COMPLETED - until the request is completed. Implies IOWAKE. The request has been completed and the caller awakened if he had requested (with IOWAKE).
- Bit 7 DATAFRZN - Set by the memory management routines (MM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MANERRORD - An error has occurred while MM was trying to make the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFALL - Delayed failure of SIO instruction. If a call to STARTNPTB resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFALL - The request was aborted because of a system power failure.

QMISC - Driver request dependent flags and counters. Used mostly for error retries.

- RETRY - Indicates an error retry is in progress.
- BACK - Backspace record processing for an error retry is in progress.
- FORWARD - Forward space record processing for an error retry is in progress.
- GAP - Gap processing for an error retry is in progress.
- BODEOF - Backspace record due to a data EOF processing is in progress.
- TOUTCNTR - GIC timed-out counter.
- FSCNTR - Forward space record counter.
- BSCNTR - Backspace record counter.
- RTCNTR - Error retry counter.

QSTAT - PCB number and request completion status.

- PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.
- STATUS - General status indicating the final state of the request. The following codes are used:

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

I / 0

MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.

Bit 8 MAKEERROR - An error has occurred while RAM was trying to make the target data segment present and freeze it in memory.

Bit 9 PREQ - (Not used)

Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.

Bit 11 PFAIL - The request was aborted because of a system power failure.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.

RSTATUS - General status indicating the final state of the request. The following codes are used:

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

G.00.00
13- 74

- Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOAWAKE).
- Bit 7 QRTAFRZN - Set by the memory management routines (MM) when a MAKEPRESENT request is successfully completed and indicates the data segment is frozen in memory.
- Bit 8 MMERRORD - An error has occurred while MM was trying to wake the target data segment present and freeze it in memory.
- Bit 9 PREQ - (Not used)
- Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
- Bit 11 PFAIL - The request was aborted because of a system power failure.

MISC - Auxiliary buffer flag used to indicate a read into the driver's buffer and not the user's buffer.

QSTRT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.

STATUS - General status indicating the final state of the request. The following codes are used:

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver.Return.Status.Codes.)

```

INSTRT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process
which made this request. If zero, the request is not
associated with any process and the IOQ element is to
be returned by the system when the request has completed.

STATUS - General status indicating the final state of the request.
The following codes are used:
    0 - Not started or awaiting completion.
    1 - Successful completion.
    2 - End-of-file detected.
    3 - Unusual, but recoverable, condition detected.
    4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general
status. (See the section Driver Return Status Codes.)

```

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

QFLAG - Request dependent flags

Bit 0	ABORT	- Request has been aborted externally.
Bit 1	MREQ	- Request is for a segment transfer.
Bit 2	OIAG	- This is a request from the diagnostic subsystem.
Bit 3	SBUF	- Target is an index relative to the SBUF Table of the data buffer.
Bit 4	IOWAKE	- Wake caller on completion of request.
Bit 5	BLOCKED	- Blocked I/O. The caller is waited in ATTACHIO until the request is completed. Implies IOWAKE.
Bit 6	COMPLETED	- The request has been completed and the caller awakened if he had requested (with IOWAKE).
Bit 7	DATAFZN	- Data segment has been present and is frozen.
Bit 8	MANERRORD	- An error has occurred while MAN was trying to make the target data segment present and freeze it in memory.
Bit 9	PREQUEUED	- Request is queued into disc's request queue.
Bit 10	SFAIL	- Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
Bit 11	PFALL	- The request was aborted because of a system power failure.
Bit 12	CURREQ	- Request is device's current request.
Bit 13	QISABLEQ	- Request is disabled.
Bit 14	QISATNPT	- Attempt to disable this request.
Bit 15	MSGDONE	- A message request reply has completed.

QLDEV, QLDEVN - Logical Device Number

QMISC - Driver request dependent flags and counters.

CHANNF'ERR'FLG	- Channel error retry flag.
RSTAT'FAIL'FLG	- Request status failed flag.
OPER'REQ'FLG	- Operator requested release flag.
IM'FAULT'FLG	- Internal maintenance fault flag.
STAT'RTY'FLG	- Status error single retry flag.
RTANS'FLG	- Retransmit required flag.
LDOR'FLG	- Media load flag.
SYS'PFALL'FLG	- System powerfail flag.

WAITCODE - Indicate type of wait:

0	- new request
1	- completion wait
2	- not ready wait
3	- release/release delay wait
4	- IOQ defer wait
5	- OSCT read wait
6	- OSCT write wait
7	- synchronization wait

6.00.00
13- 78

QOSTN - If system buffer is clear then this is the QST number of the target data segment. If bit 0 is set then buffer address is a 0B offset value instead of segment relative offset (implemented for NOWAIT I/O and NOBUFF).

QRODR - Offset in data segment or system buffer table to target data buffer.

QFUNC - Function code and qualifiers are specified by driver.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.

STATUS - General status indicating the final state of the request.

- 0 - Not started or awaiting completion.
- 1 - Successful completion.
- 2 - End-of-file detected.
- 3 - Unusual, but recoverable, condition detected.
- 4 - Irrecoverable error has occurred.

QUALIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

CS 80 Integrated Cartridge Tape Request

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	MNEMONIC
0	Request dependent flags (see below)															OFLAG
1	Request urgency class															OURGCLASS
2	Logical device number															OLDEV
3	CHANNF	RS	OP	IM	RETRY	LF	SP	WAITCODE								OMISC
4	S	OST (If process disc I/O)														OOSCTN
		OST (If segment transfer) [S=Stack]														
5	Offset in the data seg (If process disc I/O)															ORADR
	Address in Bank (If segment transfer)															
6	Unit #							Function code for this request.								OFUNC
7	On initiation, specify the word count (>0) or byte count (<0). At completion of the request this location contains the actual transmission count in the same units (byte or words) as in the request.															OWBCT
X10	P1 - Parameter 1 (Usually High Order of Current Logical Disc Address [CLDR1])															OPAR1
X11	P2 - Parameter 2 (Usually Low Order of Current Logical Disc Address [CLDR2])															OPAR2
X12	PCBN							QUALIFIER					STATUS			QSTAT
X13	Sysbase relative index of previous req in queue															QPREVREQ
X14	Sysbase relative index of next req in queue															QNEXTREQ
X15	Segment identifier (If segment transfer)															QSEGIDENT
X16	Displacement of read or wrt from seg base (NM)															QSEGDISP
X17	S	W														
	R	P														

OFLAG - Request dependent flags

6.00.00
13- 80

Bit 0 ABORT - Request has been aborted externally.
 Bit 1 MREQ - Request is for a segment transfer.
 Bit 2 DIAG - This is a request from the diagnostic subsystem.
 Bit 3 SBUF - Target is an index relative to the SBUF Table of the data buffer.
 Bit 4 IOWAKE - Wake caller on completion of request.
 Bit 5 BLOCKED - Blocked I/O. The caller is waited in ATTRCHIO until the request is completed. Implies IOWAKE.
 Bit 6 COMPLETED - The request has been completed and the caller awakened if he had requested (with IOWAKE).
 Bit 7 DATAFRZN - Data segment has been present and is frozen.
 Bit 8 MMERRORD - An error has occurred while MM was trying to make the target data segment present and freeze it in memory.
 Bit 9 PREQUEUED - Request is queued into disc's request queue.
 Bit 10 SFAIL - Delayed failure of SIO instruction. If a call to STARTIO resulted in the request being added to the channel queue, this bit indicates that the SIO instruction failed when the request was selected for execution.
 Bit 11 PFMAIL - The request was aborted because of a system power failure.
 Bit 12 CURREQ - Request is device's current request.
 Bit 13 DISABLED - Request is disabled.
 Bit 14 DISATHP - Attempt to disable this request.
 Bit 15 MSGDONE - A message request reply has completed.

QLDEV,QLDEVN - Logical Device Number

QMISC - Driver request dependent flags and counters.

CHRN'ERR'FLG - Channel error retry flag.
 RSTAT'FAIL'FLG - Request status failed flag.
 OPER'REQ'FLG - Operator requested release flag.
 IM'FAULT'FLG - Internal maintenance fault flag.
 RETRY'COUNT - Retry count area.
 LOAD'FLG - Media load flag.
 SYS'PFAIL'FLG - System powerfail flag.

WAITCODE - Indicates type of wait:

0 - new request
 1 - completion wait
 2 - not ready wait
 3 - release/release deny wait
 4 - IOQ defer wait
 5 - DSCT read wait
 6 - DSCT write wait
 7 - synchronization wait

QDSTN - If system buffer is clear then this is the DST number of the target data segment. If bit 0 is set then buffer address is a DB offset value

6.00.00
13- 81

instead of segment relative offset (implemented for MOWRIT I/O and NOBUFF).

QADDR - Offset in data segment or system buffer table to target data buffer.

QFUNC - Function code and qualifiers as specified by driver.

QSTAT - PCB number and request completion status.

PCBN - The Process Control Block (PCB) number of the process which made this request. If zero, the request is not associated with any process and the IOQ element is to be returned by the system when the request has completed.

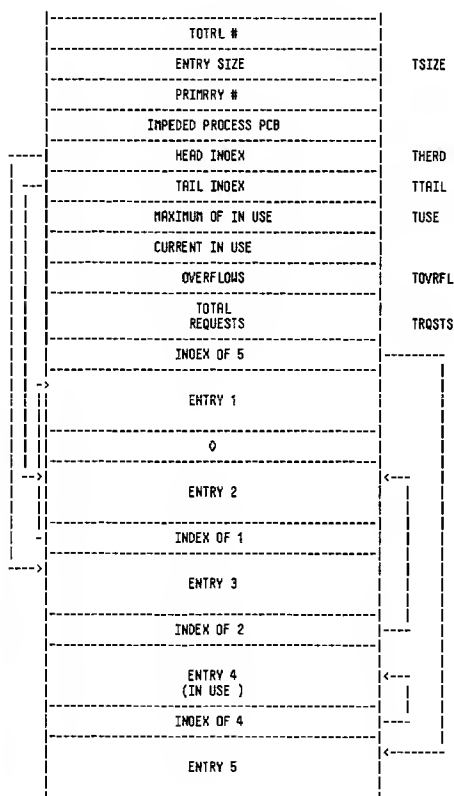

STATUS - General status indicating the final state of the request.

0 - Not started or awaiting completion.
 1 - Successful completion.
 2 - End-of-file detected.
 3 - Unusual, but recoverable, condition detected.
 4 - Irrecoverable error has occurred.

QURLIFIER - A code which further defines or qualifies the general status. (See the section Driver Return Status Codes.)

6.00.00
13- 82

SBUF Table Layout

3 - 1 - 5 - 4 - 2

6.00.00
13- 83

Table Element Allocation (SBUF)

The allocation of the elements in the IOQ terminal buffer (TBUF) and system buffer (SBUF) tables is of concern to the I/O system.

FREE LIST OF TABLE ELEMENTS

These tables are in the form of a free-linked list of the free elements. For the SBUF's the -1 word of entry is the link to the next element. For the TBUF's, word zero is the link and word 1 is the link for the IOQ elements.

Each word has an 11-word header beginning at the base of the table. The first six words of the header are for managing the table and the second five are for monitoring table activity.

The entries follow the header at word eleven.

ELEMENT ALLOCATION

Elements are obtained from the beginning of the free list, pointed to by the head and returned to the end of the free list pointed by the tail.

When the free list is empty, the head index is zero and the tail index is set to point at the head index.

The tables are divided into two areas: a primary and a secondary area. Most requests are obtained from the primary area. The secondary area is used only for critical requirements when the primary area is exhausted. These areas are logical areas determined by parameters in the header.

The utility of the core resident tables is seriously reduced if their use is not restricted to dynamic situations.

One of three responses must be specified to the routines which allocate elements from the I/O system tables.

1. Inpede caller if primary is empty.
2. Get from primary area only.
3. Get from secondary area if primary area is empty.

6.00.00
13- 84

Table Element Allocation (Cont.)

Request types 2 and 3 return an indication to the caller if the request could not be satisfied. The following table specifies the types of calls for element allocation and the action if an element is not activated.

BUFFER USER	CRLL TYPE	FINAL ACTION
SBUF's		
file system	Impede	---
Ptape	Impede	---
Bad track	Primary	forget request

IOQ's

RTTACHIO (not impedeable)	Primary	Return IOQX=0
RTTACHIO (impedeable)	Impede	---
SIODH (memory management)	Secondary	Sudden death
IDHESSAGE	Secondary	I/O error

MERDER DEFINITION

Primary # - Number of elements in the primary area.
 Total # - Total number of elements in the table.
 Size - Size in words of each element.
 Impeded PCB - If not zero then contains the PCB number of the first process waiting for an element in this table.
 Head index - Index of first free element.
 Tail index - Index of last free element.
 In use - Current number not in free list.
 Overflow - Number of requests made for an element.
 Total requests - Total number of elements requested.

ICS Global Cells With Initial Values

STDB - absolute address of the currently running process's stack.
 SBANK - bank address for process' stack.
 S - stack DB relative S
 DL - stack DB relative DL
 Z - stack DB relative Z
 PCBN - absolute stack address
 KP - PCB table relative pointer to word 0 of the running process' PCB.

The above cells are to be initialized for the PROGENITOR.

CPCB - absolute 4, is an absolute version of KP. If CPCB is zero, then the above cells are invalid. This will never be the case in a process. CPCB should also be set by INITIAL.
 SDST - DST# for running process' stack.
 JCUT - the bank zero absolute address of the JCUT table.
 PRDDR - PB relative address for the procedure PSEUDDINT.
 PSTA - status value for PSEUDDINT, Z140000+CST#.
 DISAP - PSDB counter, initially 0.

INITIAL sets the above as described.

	Channel																
	Program																

ICPVA0 - Channel Program Variable Area

G.00.00
13- 90

The first word is used by the channel program processor to store status information after I/O channel aborts. The next word is used by the driver to indicate if status should be examined for special conditions or errors. The other two words are not used.

ICPVA4 - DMA abort address

If a DMA abort occurs, the absolute address where the abort occurred is stored in this area.

ICNTRL - Contains controller information

LIM - If this bit is set, the controller is sharing a software channel resource in order to limit bandwidth.

CHANQUE - The software channel resource number.

CHAN - Channel number (four most significant bits of DRTH).

DEV - Device number (three least significant bits of DRTH).

IQUEUE - The channel program contains:

SIOPSIZE - (number of words + 1)/2 in the channel program area.

CQUEW - or a multi-unit controller this field contains the software controller resource number.

IFLAG - Controller and Channel Program state flags

RUNWAIT - An Idle Channel Program should be started when there are no active requests to process.

WAITPRDG - An Idle Channel Program has been started for this controller. This bit is reset by an interrupt.

IGNOREHI - An HIDP instruction has been issued against this controller but the channel program was not in a wait statement. Therefore ignore the interrupt generated by

NCUNIT - the channel code when this program halts. - Highest configured unit number for this controller.

ISTAT - 20 bytes of status from the idle channel program.

CHAPTER 14 SPOOLING

Input Device Directory/Output Device Directory

IDD/DDD (Common attributes referred to as XDD)

IDD: DST = 45 (= X55) DDD: DST = 46 (= X56)
 SIR = 3 SIR = 4

Overview of Table Structure

G.00.00
 14- 1

Entry 0 (Overall Table Definitions)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
0	Maximum size	Current size													0 (sectors)
1	Head entry size = 4	Subentry size = X40													1 (words)
2	Subentry area pointer (segment relative)														2
3	DD	Next avail device file ID (DFID)													3
4	Fence														4
5	Fence														5
6	Fence														6
7	Fence														7

DD: 0 ==> This is the IDD.
 1 ==> This is the DDD.

Fence: For spooled output devices (DDD), the system-wide out-fence. For spooled input devices (IDD), the jobfence.

G.00.00
 14- 2

Typical Head Entry (4 words)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence	Device outfence
Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer	Head pointer
Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer	Tail pointer
Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device	Logical device

There are two types of head entry, a class entry and a logical device entry. There is only one class entry, if it exists at all, and it is the first head entry in the XDD. All spoolfiles opened by class (e.g., LP, SLOWUP, EPOC, PP, etc.) are linked to this entry. There is one logical device entry for each real (physical, as opposed to virtual) device on the system. Output devices appear in the DDD, input devices in the IDD. AC/DC devices such as terminals appear in both directories. Each head entry is linked to 0 or more subentries (a typical subentry is shown in the next table). A null chain (0 subentries) consists of head pointer = 0 and tail pointer = segment-relative address of the associated head pointer. If one or more subentries exists, the pointers are segment-relative addresses of the first word of the first and last subentries of the chain. Any intermediate subentries are linked through the subentries. The tail subentry always contains a 0-link. The Device Outfence and LDEV# fields are meaningless for the class entry. For logical device entries (non-0 Logical Device field), a non-0 Device Outfence means that this outfence overrides the system-wide outfence in word 4 of entry 0, but only for this device.

G.00.00
 14- 3

Typical Subentry (X40 words)

0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

X11	Job name														11
X12	Job name														12
X13	Job name														13
X14	File name														14
X15	File name														15
X16	File name														16
X17	File name														17
X18	Device file ID														18
X19	XDD head index (see explanation)														19
X20	Logical device, or Device Class Table index														20
X21	Virtual LDEV number of open spoolfile														21
X22	Volume table index	Sector address...													22
X23	of spoolfile label.														23
X24	Number of extents	//////////													24
X25	Last extent size (sectors)														25
X26	Number of copies														26
X27	Segment-relative link to next subentry, this device or class. 0 ==> last subentry.														27
X28	Number of records in spoolfile (doubleword)														28
X29	Year MOD 100	Julian Day of Year/2													29
X30	Hour (24 hr)	Minute	Seconds/4												30
X31	Hour (24 hr)	Minute	Seconds/4												31

G.00.00
 14- 4

Note: Words 0-X24 are used in all subentries. Words X25-X37, although present in all subentries, are zero unless the subentry is for a spooled file (spoolfile).

Word 0: State -- State of subentry:
 0 ==> Active
 1 ==> Ready
 2 ==> Open
 3 ==> Locked
 CL -- 1 ==> Word X24 is a class index into the Device Class Table.
 0 ==> Word X24 is the LDEV associated with this subentry.

Word 1: Type -- Describes which environment created the subentry:
 0 ==> Session' (SPOOK)
 1 ==> Session
 2 ==> Job
 3 ==> Job' (SPOOK)

Word X22: ID -- 1 ==> Output DFID
 0 ==> Input DFID

Word X23: FS -- There are one or more forms message requests in the spoolfile.
 DR -- The spoolfile was created via a :DATA record (input spooling only).
 Head -- The (segment-relative address)/4 of the head entry with which this subentry is linked. Since head entries are four words long, this can be thought of as an index into the head entry portion of the XDD--if you disallow values of 0 and 1.

Word X24: -- See description of Word 0.

Word X25: VDEV -- LPDI index of virtual device LDEV. Simulates the properties of a real LDEV to the process which FORPENS a new (previously non-existing) file (State field (XDD(0). (1:2)) = 2 (Open)).

Word X26: VTIMX -- The volume table index of the logical device in class SPOOL where the file label (first extent) of the spoolfile lives.

Word X32: SQ -- 1 ==> Squeeze (purge) spoolfile extents as the final copy is printed. Obsolete starting with C.00.20.
 0 ==> Purge only when final copy printed.
 RS -- 1 ==> Restart job when warmstarting (input spooling only).
 FD -- 1 ==> There are non-standard forms on the device.
 SD -- Spaced Out bit. File System could not acquire a new extent when creating spoolfile.
 RB -- This is the \$STDLIST of an aborted job.

Words X36-37: -- Time stamp when spoolfile was made READY, or DD if not closed properly. Julian day is 9 bits starting with Word X36, bit 8.

G.00.00
 14- 5

SPOOK Tape Format

The overall format of output tapes produced by the SPOOK "OUTPUT" command is shown below. The various components of the tape are then described in detail. The format described here is subject to change as HPE evolves. Also, there may be errors in SPOOK which would cause the actual tape format to differ from the one described here in some cases. All numeric information is in integer format unless otherwise specified.

EOF
 EDF
 Label Record
 EDF
 File Directory Records
 Device and Class Directory Record
 EDF
 Spoolfile
 EDF
 Spoolfile
 EDF

Mechanisms for End-of-tape and tape switching are the same as for STORE/RESTORE tapes.

Label Record

Words 0-13: "SPOOLFILETAPE LABEL-HP3000."
 Word 23: reel number (first reel is number 1)
 Word 24: date (from CALENDAR intrinsic)
 Words 25&26: time (from CLOCK intrinsic)
 Words 30&31: "HPE V" if an HPE V SPOOK tape

G.00.00
 14- 6

All other words are zero.

File Directory

The File Directory has one entry for each spoolfile on the tape. Each entry is 12 words, and entries are packed into as many 1020-word records as needed. The last record will be padded with zeroes if necessary. The entry format is:

Word 0: Device file id number (bit 0 is on to indicate that the file is an output spoolfile)
 Words 1-3: zero
 Words 4-7: User name
 Words 8-11: Account Name

Device and Class Directory

The Device and Class Directory is contained in one 1024-word record. There is no EOF separating this record from the File Directory. This directory contains one entry for each logical device or device class linked to the spoolfiles on the tape. Also, there is an entry for each logical device in each class in the directory, whether or not that logical device was directly referenced by a spoolfile. The entries are packed into the tape record one after another in no particular order. The entry formats are shown below.

Logical Device Entry

Word 0: logical device number
 Word 1: Bits 0:8 : device subtype
 Bits 8:8 : 3 (=length of this entry in words)
 Word 2: device type

G.00.00
 14- 7

Device Class Entry

Word 0: Device class number (negated). This is the number of the entry of this device class in the system's Device Class Table.
 Word 1: Total number of words in this entry.
 Words 2 on: The entire contents of the Device Class Table entry for this device class.

Spoolfile Format

DDD entry (32-word tape record)
 Spoolfile block ---> Two spoolfile blocks packed into one
 Spoolfile block 1024-word tape record.
 Two spoolfile blocks
 Two spoolfile blocks

The first few spoolfile blocks have been modified to contain user label information from the spoolfile. This is explained later.

Spoolfile Block Format

A spoolfile block is a 512-word block that contains variable length records in spooler format. Spoolfile records start at the first word of the block. The last record is followed by a -1 to indicate that no more records follow. The last two words of the block contain a doubleword which is the record number of the first record in the block.

Spoolfile Record Format

Word 0: Byte count of record - 2
 Word *: Byte count of data portion of record. Note that this count includes trailing blanks. However, trailing blanks are truncated in

G.00.00
 14- 8

Spooling

the actual record, so this count may be more than the number of bytes actually present in the data portion.

Word 2: Function Code: 1=Fwrite
2=Fcontrol
3=Fopen
4=Fclose
X100 and beyond=FDEVICECONTROL
Word 3: P1 -- ATTACNIO parameter
Word 4: P2 -- ATTACNIO parameter
Words 5 on: Data Portion of Record

User Labels Information

Spoolfiles have a number of user labels with several kinds of information. These are:

1. Master: user label 0.
2. FOPEN entry catalog: user labels 1-10.
3. Circular queue for restart checkpointing: user labels 11-27.

Since older versions of MPE did not use user labels, a way was needed to incorporate them into the SP00K tape format without losing forward and backward compatibility. The method used is to add several special spoolfile blocks to the beginning of the spoolfile on tape. Each of these blocks has exactly one FOPEN record at its beginning. This record is followed by a -1. Thus old versions of MPE will assume that the rest of the block is garbage. However, the rest of the block is actually used to contain user label information. The first two spoolfile blocks (i.e. the first tape record of the spoolfile proper) contain only the FOPEN records. The next 5 tape records actually contain user labels in addition to the FOPEN records. The user labels are packed 3 to a spoolfile block, 6 to a tape record. Each spoolfile block of 512 words has the following format:

Words 0-4: FOPEN record
Word 5: -1 (to "terminate" the block)
Words X200-X377: user label
Words X400-X577: user label
Words X600-X777: user label

G.00.00
14- 9

Spooling

Following this special group of blocks, the spoolfile resumes a normal format. The special FOPEN records all have the number of user labels in P2.

It is often the case that some of the 27 user labels have not been initialized before the tape is written. In that case, their places will be filled with garbage. There is no easy way of detecting this except by careful inspection.

Message System General Description

The message system consists of the following parts:

- Callable intrinsic GENMESSAGE.
- Callable procedure GENMSG which is used by MPE.
- System message catalog (CATALOG.PUB.SYS) and any number of user catalogs.
- Program MAKECAT which builds message catalogs.
- MESSAGE SIR X24
- MESSAGE SYSGLOBAL CELLS X371-373
- MESSAGE DATA SEGMENT

The message system is used by calling GENMESSAGE (or GENMSG) with a message number. The message system fetches the message from a message catalog, inserts parameters, then routes the message to a file or returns the message in a buffer to the caller.

A message catalog is a numbered editor-type file containing sets of messages. The sets serve to break a catalog into manageable portions. A message system user may call GENMESSAGE using either his own message catalog or using MPE's catalog (CATALOG.PUB.SYS).

After creating a message file, run the program MAKECAT in order to build a catalog that is readable by the message system. This file is still readable by the editor (it can be "textedit") but it contains a directory (written as a userlabel).

In order to use the message catalog, the program must first open the message catalog, then call GENMESSAGE with the file number, set number and message number. (MPE users don't need to open the catalog, GENMSG automatically uses CATALOG.PUB.SYS.) The file must be opened with the options "NOBUF" and "MULTI" - record access.

6.00.00
15- 2

Message Catalog

Messages in the catalog can be of any length and can contain up to five parameters. Continuation of a message is indicated by "X" or "Z" at the end of a line. The "X" symbol indicates that the message is continued and that a carriage return, line feed be issued the terminal. The "Z" symbol indicates that the message is continued on the same line with no carriage return, line feed.

Parameters may be inserted into the message fetched from the catalog. The parameters are passed in the GENMESSAGE (or GENMSG) call and inserted wherever a "!" is found. For the system message catalog, the back slash (\) is also a parameter, reflecting a logical device number. The message is routed to the user associated with that logical device through the :ASSOCIATE command. Message sets are indicated by "SSET n" starting in column 1 (the rest of the line is treated as a comment). Maximum value for n is 63. Comments can be inserted in the catalog by placing "S" in column 1. Message numbers are positive integers, need not be contiguous, but must be in ascending order. After processing by the program MAKECAT, the catalog file contains records of 80 bytes, blocked 16, in 32 extents. (The system message catalog is only one extent, however). The format of the message catalog is as follows:

```
SSET 1  SYSTEM MESSAGES
1 LDEV #1 IN USE BY FILE SYSTEM
2 LDEV #1 IN USE BY DIAGNOSTICS
3 LDEV IN USE, DOWN PENDING
5 IS "!" ON LDEV#1 (Y/N)?
.

8 MESSAGE 35 IS TWO LINES LONG, A PARAMETER STARTS THE
9 FIRST LINE AND THE SECOND LINE IS "HP32002"
35 IN
HP32002B.00.1
.
.
276 LDEV # FOR "!" ON 1 (MUN)?
.
SSET 2  CIERRA MESSAGES
82 STREAM FACILITY NOT ENABLED: SEE OPERATOR. (CIERR 32)
200 MORE THAN 30 PARAMETERS TO BUILD COMMAND. (CIERR 200)
.
.
204 FILE COMMAND REQUIRES AT LEAST TWO PARAMETERS, INCLUDING
```

6.00.00
15- 3

THE
FORMAL NAME OF THE FILE (CIERR 204)

MAKECAT Program

The program MAKECAT.PUB.SYS is used to build message catalogs (and also HELP catalogs). The program's input file has the formaldesignator INPUT, which must be used for all entry points. The program has the following entry points:

(no entry point) - Reads from input file and builds a temporary file (formaldesignator CATALOG). Also removes any old temporary CATALOG, CATon, using an archival numbering scheme (i.e., CAT1, CAT2, etc.).

BUILD - (Must log on under MANAGER.SYS.) Reads from input file, build the system message catalog (formaldesignator CATALOG), and installs the message system. Existing catalog is renamed CATnnnn according to the same scheme as for no entry point (above). Installation of the message system means moving the directory contained in the userlabel of the catalog into a data segment. The DST number and the disc address of CATALOG are placed in system global area. The message system may be installed while the system is running.

OIR - (Must have PM or OP capability.) Installs the system message catalog (does not build a new one). Opens input file, moves the directory in the CATALOG into a data segment, and places the DST number and disc address of CATALOG in system global area. This may be done when the message system seems to be "broken", but the catalog is intact. (MPE is issuing "MISSING MSG. SETmm MSGmm" at terminals and at the console.) This may be done while the system is running.

HELP - Used to build the HELP catalog. Reads input file and builds a HELP catalog (formaldesignator HELPCAT).

Field Definitions

BCDMIMAGE: Byte pointer to CDMIMAGE (sometimes called WCDMIMAGE) in the CI stack.

COMMAND IMAGE: Command character string currently being executed.

LINELENSTACK: A CI command can span up to 30 input lines. This stack holds the length of each input line.

NEXTMSG: Used to be used to link messages together. No longer being used.

THIS IS SPARE: Not used.

UDC0: Holds the OST number of the UDC definitions.

UDC1: Holds the old S register value for UDC's.

UDC2: (0:1)--FLUSHUDC, used by :SETCATALOG

UDC3: UDC options for current UDC.

UDC4: (0:1)--UDC Fatal CI Error
(1:1)--UDC EXITBREAK
(2:1)--UDC BREAKDETECTED
(3:1)--UDC NOPRINT
(4:1)--UDC IMAGEADJUST
(10:6)--UDC NESTLEVEL

IFNESTING: Level of nesting of :IF commands.

IFSKIP: Whether the current commands are being skipped as the false part of a :IF command.

ELSESEEN: Level of the :ELSE commands.

CIFLAGS: (13:1)--Sequenced: line numbers at rear.
(15:1)--Not REDDable (last command).

CONTINUE STATE STACK: History of the :CONTINUE commands.
= 0--no :CONTINUE
= 1--just seen
= 2--in effect.

PENDINGCNLEN: If <> 0, command is already in stack and this word is the command string length.

BLASTCDMIMAGE: Byte pointer to last command image.

LAST COMMAND IMAGE: When a command completes execution, the command string is copied here for use by the :REDO command.

CHAPTER 17 MISCELLANEOUS

Labeled Tape Subsystem

The MPE labeled tape subsystem permits convenient access to tapes labeled to either RANSI or IBM standards. It operates as a set of subprocedures to the file system. R labeled tapes consist of one or more logical files. Each logical file consists of three physical files, i. e. tape areas delimited by tape marks. The first physical file contains header labels, the second contains the data, and the third contains trailer labels which are (except for minor differences) copies of the header labels. The tape mark following trailer labels will be followed either by header labels for the next file, or by another tape mark if there is no next file. Labels are 80 bytes long, and conventionally are identified by their first four characters (three letters and a digit) and contain information as follows (CP := character position; L := length):

VOL1: Present only on the first file of a volume, the volume label contains the volume identifier, which is usually the number on the tape strap, and is thus not expected to be changed.

CP	Field Name	L	Content
1/3	Label identifier	3	"VOL"
4	Label Number	1	"1"
5/10	Volume Identifier	6	Vol ID
11	Accessability	1	"0" if IBM, else " "
12/79	Not used	62	Blanks
80	Label-Standard Version	1	"1" if HP RANSI else " "

U/Ln: User volume labels. May be present on tapes from foreign shops, but are not written by MPE. If encountered, they are ignored.

G.00.00
17- 1

HDR1: First header label. Required for each file. Specifies:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"1"
5/21	File Identifier	17	File name, if tape was not written by MPE, only the first eight are significant.
22/27	Volume Set Identifier	6	Names the volume on which the set of files begins
28/31	Reel Number	4	Counts the reels that contain this file (1 starts)
32/35	File sequence number	4	Counts the files in the set of files (1 starts)
36/41	Not Used	6	MPE writes blanks
42/47	Creation Date	6	Year and day within year when the file was written.
48/53	Expiration Date	6	Year and day within year when the file may be overwritten without permission.
54	Accessability	1	X230 if Lockword, "0" if IBM
55/60	Block count	6	Number of blocks if IBM.
61/73	System Code	13	"MP MPE 3000 "
74/80	Not Used	7	Blanks

HDR2: Second header label. Although defined by the standard, may be missing on foreign tapes. Contains:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"2"
5	Record Format	1	"F" = Fixed "V" = Variable "U" = Undefined Others treated as Undefined
6/10	Block Length	5	Block Length (in character)

G.00.00
17- 2

CP	Field Name	L	Content
11/15	Record Length	5	Record length (adhering to MPE rules) in characters.
16/23	Lockword	8	MPE File Lockword.
24/35	Not Used	13	MPE writes blanks
37	Record Type	1	"R" = ASCII "B" = Binary.
38	Carriage Control	1	"C" = control " " = no control.
39/80	Not Used	42	Blanks

IBM has a slightly different format. It is:

CP	Field Name	L	Content
1/3	Label identifier	3	"HDR"
4	Label Number	1	"2"
5	Record Format	1	"F" = Fixed "V" = Variable "U" = Undefined Others treated as Undefined
6/10	Block Length	5	Block length (in character format).
11/15	Record Length	5	Record length (adhering to MPE rules) in characters.
16	Not Used	1	Blank.
17	IBM Position	1	"0" = no volume switch "1" = a switch has occurred.
18/38	Not Used	11	Blanks.
39	IBM Block Attribute.	1	"B" = Blocked records. "S" = Spanned records. "M" = Blocked and Spanned. " " = No blocked or spanned.
40/80	Not Used	41	Blanks

G.00.00
17- 3

User header labels: optional. Standard prescribes U/Ln in the first four characters, but MPE doesn't care.

EDV1: End of Volume: used as first trailer label. Required if the logical file is continued onto another reel. Identical to HDR1, except contains the number of physical blocks of data in the data area.

CP	Field Name	L	Content
1/3	Label identifier	3	"EDV"
4	Label Number	1	"1"
5/54	Sans as HDR1	50	
55/60	Block Count	6	Number of data blocks since last beginning of file section label group.
61/80	Sans as HDR1	20	

EDV2: Defined by the standard, but may be missing on foreign tapes. Follows EDV1; format same as HDR2.

EDF1: End of File; used as first trailer label. Required if this is the end of the logical file. Format same as EDV1.

EDF2: Same as EDV2 except used after EDF1.

User trailer labels: optional. Standard prescribes U/Ln in the first four characters, but MPE again doesn't care.

Labeled Tape Subsystem

VCB (Cont.)

	26
	27
Volume name	30
	31

R: ASCII POSITION

F: Flush bit - operator did REPLY (pin), 0.

D: DEVREC Wait (used with reelswitching).

Position: Gives head position within logical file.

0 = at load point (LDPM)

1 = H0R1 label next (N1MX)

3 = after H0R2 label (AM2)

4 = after user header labels (AMU)

6 = data next (DMX)

7 = after data (AD)

8 = EOF1/EDV1 label next (T1MX)

10 = after EOF2/EDV2 label (RT2)

11 = after user trailer labels (ATU)

W: Write access specified.

SeqType: File open sequencing type.

0 = match filename

1 = NEXT

2 = REOF

3 = use file sequence number

LblType: As in LCB entry.

L: Linkwait - mark left by CREATETITLE for LINKLABEL.

M: Mount wait - waiting for operator to mount tape on FOPEN.

R: Reelswitch wait - waiting for next reel.

B: Busy bit - this entry is in use.

LDEV N: Logical device number of tape drive with this volume, only if linked. Otherwise, 0.

S: STORE tape.

R: REELSWITCH has been done. Used by STORE/RESTORE to handle STORE label and directory file.

D: Next file is directory. Used by STORE.

C: VDL1 label is to be created (written).

Density: volume set density. During a volume set open, contains the density requested by the user in FOPEN. Once the volume set is open, contains the actual density of the volume set. Only valid for tapes on variable density tape drives.

0 = default density for volume set open

1 = 1500 BPI

2 = 6250 BPI

V: 1 if volume set is being opened. Reset after completion of FOPEN.

0.00.00
17- 9

Labeled Tape Subsystem

Volume Recognition

Volume recognition is the responsibility of DEVREC, which reads the first record of a newly-mounted tape on an unowned drive and passes the record to AVREC. AVREC may see: VDL1 in the first 4 bytes, in ASCII, in which case the tape is ANSI; VDL1 in the first 4 bytes, in EBCDIC, in which case the tape is ISM; Anything else, in which case the tape is considered unlabelled.

If the tape is unlabelled, AVREC reports to DEVREC that no further action is required. If the tape is labelled, AVREC wants to see the first H0R1 label, so asks DEVREC to read another record. (Unfortunately, DEVREC cannot be stopped long enough for AVREC to do its own read.) When the H0R1 record is found, the volume entries can be searched to see if there is a pending request for this volume. If so, the waiting process is restarted.

If the system has been restarted with tapes mounted, there will not be interrupts to alert DEVREC. The procedure RECOGNIZE is called when needed to see if any such tapes exist.

Opening a File

FOPEN gets into the tape label code in three different places. The first is to call CREATETITLE, which parses the string passed in the FORMSMSG parameter to identify the labeled tape file required. If there is no existing corresponding entry in the volume area, this is a volume set open, and a new volume entry is created. There may be an existing entry (if the tape was FOPENED and FCLOSED with disposition 2 or 3), in which case there is an associated LDEV entry for the drive on which the tape was left mounted by the prior operation; in this case, the new information is stuffed into the existing volume entry. R bit (LINKWAIT) is left set to mark the entry for LINKLABEL.

The second entry is through LINKLABEL, which is called from ALLOCATE. At this time, it is necessary to identify the LDEV to be used for the tape. If no LDEV is associated, the LDEV entries are searched to see if the operator has already mounted the required tape; if so, the volume and LDEV entries are cross-tied and LINKLABEL is done. If the search turns up nothing suitable, the operator is requested to mount the appropriate tape, and the procedure waits for either a REPLY or for AVREC to discover the appearance of a suitable tape and restart the process. If the operator enters a reply, it is validated.

The third entry is through POSITION, which is responsible for positioning the tape to the requested file. At the file, the H0R1 and H0R2 label are examined as required to determine the file characteristics.

Reading and Writing Files

All procedures which move tape go through the catchall procedure CHECKUL, which takes care of necessary labeled tape doings. The code insures that the sequence: header labels (including user labels), data, trailer labels

0.00.00
17- 10

Labeled Tape Subsystem

(including user labels) is maintained. There is a separate CASE leg for each such procedure.

If an EOT reflective mark or an EOF in data is found, REELSWITCH is called (principally from the file system procedure IONMOVE) to call for the next reel, if any. If another reel is needed, the tape drive is set Unowned so that AVREC will be called to recognize the new tape when it is mounted. REELSWITCH returns to its caller when it is satisfied that an appropriate tape is mounted.

Closing Files

FCLOSE calls CHECKUL to handle writing EOF1 and EOF2 if needed and resolving the tape position. If the disposition is 3, the tape is left positioned at the next file. If the disposition is 2, the tape is supposed to be left at the beginning of the current file, but the code does not presently provide for reelswitching if the present file began on a prior reel.

At present, ensuing volumes of a multi-volume set must be mounted on the same drive as the first, mostly because neither the file system nor STORE-RESTORE was capable of dealing with LDEV changes in the middle of a file. REELSWITCH reports the LDEV being used, however, so that the capability of using a different LDEV can be added in the future.

Store-Restore

Complications ensue on labeled STORE-RESTORE tapes because there needs to be a file directory at or near the beginning of each tape of a multi-volume set; RESTORE uses this directory to determine whether the specified file(s) can exist on this tape. Because the reel switching process would otherwise be invisible to STORE-RESTORE, special bits (VCB:RSDOME and VCB:WRITDIR) are kept to enable special intrinsics callable by STORE-RESTORE to report whether a directory needs to be written or is about to be encountered.

The special procedure NEXTTAPEFILE is used by STORE-RESTORE in lieu of doing a FCLOSE(3) followed by an FOPEN to get to the next file. This permits cleaner handling of both REPLY 0 and Forward Space (logical) File over a Reelswitch, as well as saving the time needed to tear down and reconstruct all the control blocks.

Miscellaneous

PVOLID is used by the SHOWDEV command processor (in SPOOLCOMS) to obtain the name of the volume on the specified drive without having to know the structure of the tape label table. For the same reason, TGETINFO is used by the FILEINFO intrinsic (in FILEIO) to get labeled tape information.

System failure 86 in MPE is defined as a major problem in LABSEG. Generally speaking it is a problem with the TLT setup, for example if LABSEG cannot find an LDEV in the table.

Timer Request List (TRL)

The system clock interrupts every 100 ms, with the CR being automatically cleared. An exception is the Shared Clock Interface measurement service which allows rates as fast as 5 ns. The interrupt handler is the procedure TICK. On entry, DB is pointing to the base of timer request list. Besides timeout requests, the clock also controls time slicing.

MPE User Logging

MPE USER LOGGING enables users and subsystems to log changes to data sets on disc or serial files. This "change" file can later be used to recover data lost due to a system or program failure. The log file can itself be used for auditing purposes.

General Design Overview

Hardware Environment

No special hardware is required to operate the system. However, if logging to a tape file is desired, the hardware configuration must include a tape drive. If there is no tape drive, then may log to a serial disc class device.

Software Environment

MPE User Logging is an integral part of MPE. No other special software is required.

Design Narrative

User Logging enables users and subsystems to journalise additions and modifications to MPE and subsystem files. The journal can reside on either disc or serial logfiles.

User Logging consists of a logging process, a memory buffer, a disc resident logging buffer (for serial logging) and a user defined destination log file on disc or serial media.

The logging process has two functions depending on whether the destination file resides on disc or serial media. If the destination file is serial, the logging process performs all output to the destination file. If the destination file is on disc, the logging process allocates additional space (extents) as it is required by the user.

The logging buffer is divided into communication and buffer areas. The communication area is used to pass information among the users and the logging process. This information includes status of the logging process and logging file, space remaining in the logging file and error information important to users or the logging process. The buffer portion of the logging data segment blocks inputs into the logging file before the data is actually posted. The buffer is flushed any time a user requests to close a log file or when a logging process is terminated. (The buffer is also flushed by the begin/end transaction or buffer flush requests).

G.00.00
17- 19

Timer Request List

Error Recovery Description

The error recovery mechanisms provided by User Logging are: power fail recovery and recovery from system failure.

Power failure recovery applies only to tape log files since MPE provides adequate recovery for disc files during power fail. When a power failure is detected, a message will be printed on the console asking the operator to place the tape drive back on-line. (If the operator places the tape on-line before the message valid data may be overwritten). (To reset the tape drive the operator must hit the load button until the tension returns to the drive. Then hit the reset button followed by placing the tape drive back on-line). At this time the log process will recover the file by rewinding to the load point and then forward spacing to the point where the power fail occurred. Writing to the log file will continue at that point.

In the event of a system failure, the warm start load option initiates recovery of User Logging files. In the case of a serial file, the file is read and compared to the disc logging buffer. All records found in the disc buffer that are not on the serial log file are posted and a proper end of file written. If the destination file is a disc file, all records are read and verified and an end of file posted to the file. In order to continue logging to a User Logging file that has been recovered in this manner, the logging process for the file must be restarted using the console command :LOG.

NOTE:

Rny records in the buffer area of the logging buffer will be lost.

User logging has been enhanced to work with labeled serial discs. Internally the log process handles serial disc (or cartridge tape) log files the same as for tape files.

User Logging Table

LCNAME
The name of the logging process (logging identifier).

BNAME
The name of the disc buffer used if the logging process destination file is a serial file. This is a file that resides in PUB.SYS. The format of the name is ULOGxxxx where xxxx is the buffer number padded on the left with zeros.

If the switch flag is true, the following will be the fully qualified file name of the new log file.

LFNAME
The name of the logging file.

LFLOCKW
The lockword of the disc logging file.

LFGROUP
The group that the destination logging file resides in if the file is a disc file.

LFACCT
The account that the destination logging file resides in if the file is a disc file.

NUMUSERS
The number of users currently accessing the logging file.

DST
The dst number of the logging data segment (LOGBUFF). (-1 = LOGBUFF not created yet)

STATUS
The status of the logging process.
INITIALIZING = -1
INACT = 0
ACT = 1
RECOVERING = 2

LGAUTO
True if the automatic changelog facility was enabled. (Not used - for future use).

LGTTYPE
The type of destination file of the logging process.
DISC = 0
TAPE = 1
SDISC = 2
CTAPE = 3

LGDEV
The logical device number of the disc logging file or the disc logging buffer.

PIN

G.00.00
17- 25

User Logging Table

The PCB number for the logging process (PIN * PCBSIZE).

LGSWITCH
Flag indicating a CHANGELDG is pending (if true). (Not used - for future use).

LGNEWAUTO
True if the automatic changelog facility was requested for the new log file. (Not used - for future use).

LGNEWTTYPE
If a switch is pending, this will be the type of the new log process. (-1 = no switch pending). (Not used - for future use).

LGADDR
Sector number of the current extent in the disc logging file or the disc buffer file. (Disc buffer file has only 1 extent)

BSIZE
The number of records in the current extent (for disc logging) or the number available in the disc logging buffer.

NEXT
A table relative pointer to the next entry in the logging table. (-1 = this is last entry)

PREV
A table relative pointer to the previous entry in the logging table. (-1 = this is first entry)

G.00.00
17- 26

User Logging Buffer

User Logging Buffer

There will be one of these tables around for the life of any active user logging process. The table consists of three parts:

COMMUNICATIONS AREA - Information about status of the process, etc. that is common to all users of the process. Also the cells for messages to/from the process.

USER ENTRIES - Information for a specific user of the process. One of these for every user of a process (Setup by OPENLOG, released by CLOSELOG).

BUFFER AREA - Buffer used to hold logging records from all users before writing to the log file.

G.00.00
17- 30

User Logging Buffer

```
LOGMSG
R Messages from the logging process.
    6 - Continue processing, all is fine.
    15 - EOF - if there are no more extents available to be
        allocated.
    12 - Disc space - could not allocate the new extent because
        no space left in the group.
    9 - Write error - error occurred while writing to log file

USERMSG
R Messages from the user process.
    6 - Continue processing, all is fine.
    12 - Disc space - user process needs another extent allocated
        for disc logging.

LOGERR
Last error found. After changelog:
    -W - File System error number encountered
    0 - No error
    -1 - New disc log file was not empty
    -2 - New disc log file did not have file code LOG
    -3 - New disc file is too small
(Not used - for future use).

LOGDEV
The logical device number of the current extent of the disc log file or the
disc buffer file (buffer file has only 1 extent).

BSPACE
The amount of space, in records, that are currently available to the users.
On the last block of the last extent, one record will be saved by the logging
process so that the proper close information can be posted to the file -
either the trailer record (if the log logging process is stopped) or the
change-to-new record because of an EOF condition (and the AUTO option had
been specified).

BUFSIZE
The number of records currently in the buffer. On all extents, except the
last extent BUFSIZE+BUFSIZE = 32 (number of records in a complete block).
However, on the last block of the last extent this will NOT be true since one
record is always held in reserve by the logging process.

VSETNO
This shows the order in the log file "set" of the currently opened log file.
(Not used - for future use).

LOGADDR
The disc address of the current extent of the disc log file. If it's a
serial file, this is the disc address of the disc buffer for the file.

INBUFILE
The record number of the next block to be written to the logging destination
file or the disc logging buffer for serial files. (Used as an offset into
the current extent for the writes - since each record is one sector in
length).
```

G.00.00
17-32

User Logging Buffer

FSIZE

The current extent size of the logging destination file or disc logging buffer file for serial destination files. (On the last extent this will be the last extent size minus 1).

FSPACE

The space in records that remains in the current extent of the disc logging destination file or disc buffer for tape destination files. (On the last extent of the disc log file, this is the amount of space minus 1).

TRECS

The total number of records written to the logging destination file (including those records currently in the buffer).

MAXFSPACE

The total file size, in records, minus 1. (Need that last record to post close information).

LASTEXT

The extent number of the final extent in the disc logging file or disc buffer file.

EXTENT

The current extent number of the disc logging file or disc logging buffer.

RESOURCE

Used for resource management (i.e. locking the LOGBUFF). Format is:

RESOURCE + 0 = Owner PCB number
 RESOURCE + 1 = Head of impeded queue PCB number
 RESOURCE + 2 = Tail of impeded queue PCB number
 RESOURCE + 3 = Queue length

UHEAD

A table relative pointer to the first entry into the logging data segment. (-1 = no entries currently in use)

FHEAD

A table relative pointer to the first free entry in the logging data segment. (-1 = no free entries)

G.00.00
 17- 33

User Logging Buffer

TYPICAL LOGBUFF ENTRY

#		X

 USTATE = INDEX+14
 ERROR = INDEX+15
 LGNUM = INDEX+16
 SCODE = INDEX+17

RECS = OINDEX+9

NENTRY = INDEX+23
 PENTRY = INDEX+24

USER

The name of the user who opened the logging file through this entry.

GROUP

The group of the user who opened the logging file.

ACCT

The account of the user who opened the logging file.

UPIN

The PCB number of the user process (PIN * PCBSIZE).

OPENCNT

Counter of how many times this user called OPENLOG. (Incremented for every OPENLOG, decremented for every CLOSELOG). (Not used - for future use).

USTATE

The wait status of the users process.

INACTIVE = 0
 ACTIVE = 1

ERROR

Used to hold error information for this user.
 -1 = No room in disc (or disc buffer) and NOWAIT.
 0 = O.K.

LGNUM

The logging number assigned to the user. (From USERNO in global area to be used as log # in the log record).

SCODE

The subsystem code for the caller. This applies only to privileged callers.

RECS

The number of records written by this user.

G.00.00
 17- 35

User Logging Buffer

NENTRY

A table relative pointer to the next entry in the logging data segment. (-1 = this is the last entry)

PENENTRY

A table relative pointer to the previous entry in the logging data segment. (-1 = this is the first entry)

G.00.00
 17- 36

Logging Identifier Table

User Logging Identifier Table

ENTRY SIZE = #33 words
DST X41

Table containing an entry for each potential logging process. Entries are added via :GETLOG and released via :RELLOG.

Entry #0	#	X
0		0
1	MAX NUMBER OF ENTRIES	1
2		2
3		3
4	ENTRY SIZE	4
	.	
32	.	40

ENTRIES

MENTRIES = LIOTAB(1)
ENTRYSIZE = LIOTAB(4)

MENTRIES

The maximum number of entries in the table. (i.e. maximum number of user logging processes. 1 entry for every process - activated or not).

ENTRYSIZE

The size of each entry in the table.

G.00.00
17- 37

Logging Identifier Table

Typical Entry

#		X
0	LOGGING IDENTIFIER	0

FRCTY = BLIOTAB(40)
UNAME = BLIOTAB(48)
URCTY = BLIOTAB(56)

WORD ENTRIES

TYP = LIOTAB(32)

LIO

The logging identifier name. This is a maximum of eight characters long.

PW

The pass word for the logging identifier. This is a maximum of eight characters long.

The following is the fully qualified file name of the current log file.

FNAME'

The name of the destination file.

LU

The lock word on the destination file if the file is on disc.

FGROUP

G.00.00
17- 39

Logging Identifier Table

The group that the file resides in.

FRCTY

The account that the destination file resides in.

UNAME

The name of the user who created the logging identifier.

URCTY

The account of the user who created the logging identifier.

TYP

The status of the entry. -1 = null entry
0 = disc logging file
1 = tape logging file
2 = serial disc logging file
3 = cartridge tape logging file

G.00.00

User Logging Record Formats

DATA FIELDS OF LOG RECORDS

REC# = DDUBLE INTEGER
 CKSUM = INTEGER
 CODE = INTEGER
 TIME = DDUBLE (from intrinsic CLDCK)
 DATE = INTEGER (from intrinsic CALENDAR)
 LOGID = ASCII
 LOG# = INTEGER
 LEN = INTEGER
 USERAREA = ASCII
 CREATDR = ASCII
 PCB = INTEGER

NOTE:

1. The checksum algorithm uses the exclusive or (XOR) function against a base of negative one.
2. Null record is used for filler.
3. The code word of the logging record can contain a subsystem code defined by the user in the first half of the word (0:8). User logging allows privileged users to pass this code in the index parameter of the Openlog intrinsic.
4. The "len" field will contain the entire length of the data in the transaction (i.e. the length passed to WRITELOG, BEGINLOG, ENDLOG). If a continuation record is part of the transaction, it will also contain the entire length of the data. For example, a length of 140 was passed to the intrinsic. The "len" field of the first record will be 140, the "len" field of its continuation record will also be 140 - even though the actual amount of data found in the first record will be 119 and the data found in the continuation record will be 21.
(Positive length = # words, negative length = # bytes)

CHAPTER 18. MESSAGE FILES

Message File Data Structures

This chapter contains the data structures necessary to support message files. The first section details the message file's version of the familiar file system data structure; ie, the file label, file control block, access control block, etc..

The second section shows the tables used by the basic IPC mechanism which is a set of internal, MPE procedures designed to support the "boundary conditions" of IPC files. For example, signaling a no wait reader that its record has arrived. See the section's introduction for a detailed description.

File Structure

File Label/FCB Extent Map

	End of file block	Start of file block
Disc addr of extent 0	.	.
Disc addr of extent 1	v	.
Disc addr of extent 2	-	.
Disc addr of extent 3	.	.
Disc addr of extent n-1	.	v
Disc addr of extent n	.	-

The EOF and SDF are examples only, meant to show:

- 1) The start of file moves into the extent map as records are read
- 2) The file can wrap around and, hence, cause the SDF to be greater than the EOF.

When a file becomes empty the SDF and EOF are reset to the first block of extent zero.

Each extent is composed of a number of blocks. Extents all have the same number of blocks. Extent zero also contains space for the file label and user labels in the exact same format as standard files. Starting with block zero, sufficient blocks are allocated to the file label/user labels to satisfy their space requirements.

Extents outside of the SDF/EOF range may not exist. They are deleted at close time when there are no more writers accessing the file.

G.00.00
18- 1

Block Structure

First data record	*****
Second data record	Exact same format as standard variable length blocks.
Last data record	
Record delimiter (-1)	*****
Empty space (next record would not fit)	
Header delimiter (X77)	
Last header record	
Second header record	
First header record	

Separating the data portion of the records from their header enables the standard file system access procedures to read the records with no knowledge that they are msg file records.

Record Format

Number of bytes in record
First data word of record
Last data word of record

Length word's value does not include itself.

G.00.00
18- 2

Header Format

C LC	Header Type	0
Writer's ID		-1

C (0:1) - Set on if this was the last record written before the system crashed. This bit is set on by the first open on the file after the crash.

LC (1:1)- Valid only for close headers. Set to one if this is the last writer to close the file.

Type(8:8)- 0 data
1 open
2 close

Message Access Control Block

Notes:

1. Words/fields that do not pertain to message files are left blank.
2. This diagram shows the "combined" ACB as it appears to the message access procedures (the procedures in IPC). Thus it is a combination of the LACB and the PACB.

-5	DST number of the PACB	-5

DST rel address of buffer two

* Value is private to a particular accessor.

Word Field Description

66	Accessor's local flags.
(0:1)	0 1 - have not yet issued an FREED/FWRITE against the file.
(1:1)	ex 1 - extended wait mode.
(2:1)	nd 1 - do not destroy the next record read.
(3:1)	vr 1 - writer has not yet written his first record (ie., he is a virgin).
(4:1)	bt 0 - transmission log should be expressed in words.
(5:1)	cls - Not currently used (reserved for group IPC standard).
(6:1)	C - No wait completion message is in LRCB area.
(8:8)	car ctl- carriage control character to be used for the writer's record (a value of one indicates no carriage control character).

5.00.00
18- 7

Message Files

Word	Field	Description
40		File's global flags.
(1:4)		- number of read buffers
(5:4)		- number of write buffers
(9:1)	er 1	- extended read
(10:1)	qu 1	- one or more writers has been queued on the wait queue.
(11:1)	n 1	- wait msg is located in the RCB
(12:1)	c 1	- completion msg is located in the RCB
(13:1)	d 1	- the current write buffer has dirty bit set
(14:1)	s 1	- the start of file is block zero
(15:1)	f 0	- the RCB buffers have not been filled

Message Files

MNSTAT Definitions

Octal Value	Event Type	Parameter 1	Parameter 2
72/0	Read init	# free rec	
72/1	Read compl	(0:8) error, (8:8) ID	Number of records
72/2	Write init	(0:8) # rec, (8:8) ID	Number of free records
72/3	Write compl	(0:8) error, (8:8) ID	Number of free records
72/4	Control	(0:8) error, (8:8) ID	(0:4) func, (4:12) parm
72/5	EDF	(0:8) error, (8:8) ID	Number of records
72/6	Dpen	(0:8) error, (8:8) ID	Number of records
72/7	Close	(8:8) #free, (8:8) ID	Number of records
72/10	Initiation D		(0:8) fix, (8:8) update
73/0	Put record	(0:8) error, (8:8) ID	(0:3) rec type, (3:13) number of records
73/1	Delete rec	(0:8) error, (8:8) ID	(0:3) rec type, (3:13) number of records
73/2	Delete blk	Start of file block #	End of file block #

Notes:

1. The aa/bb notation in the "octal value" column denotes type/subtype. Type is the actual MNSTAT event number. Subtype is (D14) of parameter 0.

2. Several items can possibly exceed their fields, in that case the bits beyond the field are lost. These items are number of records, number of free records, start of file, and end of file.

G.00.00
18- 9

Message Files

3. Parameter word zero has a common format for all the MNSTAT events.

Field	Description
(0:4)	Event's subtype.
(4:2)	File's state 0 - empty 1 - partially full 2 - only a fraction of a free record is left 3 - completely full
(6:1)	Nonzero indicates that there is one or more waiting readers.
(7:1)	Nonzero indicates that there is one or more waiting writers.
(11:1)	Nonzero indicates that the write has a carriage control character.
(12:4)	Flags local to the accessor. (12:1) - the accessor has done no FREADS/FWRITES (13:1) - extended wait (14:1) - nondestructive read (15:1) - writer has not written any records

G.00.00
18- 10

Message Files

File System Basic IPC Definitions

The objective of this set of uncallable procedures is to provide a simple ipc mechanism to support the ipc file access procedures. It enables one process to send short, control messages to another process.

General Behavior

FCPORTDPEN Procedure

The heart of this mechanism is the port. A process desiring to receive messages would first open (create) a port. This process is termed the "port manager." When the port is created, a port number is returned to the opener. Since the port number value cannot be known in advance, potential senders need some method of obtaining the port number from the port manager.

Both the ports and the messages are contained in a single disc resident data segment. There can be a total of over thirty-five hundred open ports and outstanding messages. Thus neither ports nor message blocks are scarce resources.

FCPORTSEND Procedure

This procedure sends a D to S word message to a port. Optionally a timeout value may be specified which will limit the duration the message will remain attached to the port. Expiration of the timeout causes the message to be deleted from the target port's queue and placed on the sender's reply port (specified by the sender in the FCPORTSEND procedure call).

{FCPORTRECEIVE}

Reads and deletes the head message from a port. The sender's return port number is also given to the receiver, enabling him to send a reply message.

{FCPORTCLOSE}

Demolishes the port.

{IPC file's use of this mechanism}

All open message files have two ports open for the file (read wait queue and write wait queue), plus one port per accessor (reply port). Their use is described in the following.

G.00.00
18- 11

Message Files

Reader and writer wait queues) R When an empty message file is accessed by more than one reader (share), then there must be a way of having the readers' FREADS satisfied in the same order that they were issued. That is, there must be queue of waiting readers. The ipc access procedures accomplish this by dedicating a basic ipc port as a "read wait queue." Whenever a reader's request is stalled because the file is empty, a message is sent to the read wait queue. Subsequent FREADS by other processes will queue up behind the first reader in a FIFO manner. An FWRITE will take the first entry from the wait queue and send a "read may be done" message to the reader's reply port.

In a like manner multiple writers will queue on the write wait queue when the file is full.

{Completion notification for nowait I/O}

The IDWAIT intrinsic waits for a message to be sent to the reply port (s) of the specified user files.

{Timeouts}

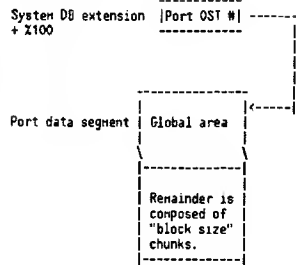

When an accessor encounters a boundary condition (ex, a reader accesses an empty file), it may specify that the condition must be satisfied in x seconds (FCNTROL 4). To this end the ipc access procedures merely issue the FCPORTSEND to the wait queue with the user's timeout value specified. The timeout will tear the message from the wait queue and place it on the accessor's reply port.

CHAPTER 19 MPE MEMORY RESIDENT MESSAGE FACILITYOverview of Facility

The memory resident message facility of MPE V addresses the need for an efficient, simple, and uniform method for system code to send short status-type messages to processes.

Each process is created with a "port" in the message harbor table (DST X71) which supports a set of message subqueues which are private to that process. There is a maximum of four subqueues per port in the initial implementation. This limit can be easily extended when new subqueues are required.

Any system code, even code running on the ICS, can send a message to any subqueue of any process. The destination process' PIN must be known, any a priori conventions on subqueue number and message formats must be established. The caller of SENDMSG may optionally specify that the destination process be awakened from a message wait.

Message can be any length up to the configured maximum. Message length is specified in the call to SENDMSG and RECEIVMSG. In the initial implementation, messages are limited to 4 words in length. This maximum can easily be increased if the need arises.

By calling PORTSTATUS, a process may at any time determine whether a specified subqueue is non-empty or obtain the subqueue number of the most urgent non-empty subqueue (lowest numbered one).

By calling RECEIVMSG, a process may receive the message at the head of the specified subqueue. This receive is optionally non-destructive.

A process can wait on a message wait, or on a combination of message wait and other wait types.

Message IntrinsicSENDMSG

```

Procedure SENDMSG(Destpin, Subqueue, MsgLength, Flags);
Value           Destpin, Subqueue, MsgLength, Flags;
Integer         Destpin, Subqueue, MsgLength;
Logical         Subqueue, MsgLength;
Option Privileged, Uncallable;

```

Destpin, Subqueue, and MsgLength have to be within range or a System Failure 622 will occur.

The caller of SENDMSG stacks the message contents before calling the procedure. SENDMSG expects the first msg word to be at Q-7-MsgLength, and the last msg word at Q-8. The message contents at Q-8 to Q-7-MsgLength are deleted from the top of stack by the exit from SENDMSG to the caller.

Flags.(1:1) = 1 ==> Wake-up destination process from a message wait.

G.00.00
19- 1

Return CC = CCG if process was already awake else CC = CCE.

PORTSTATUS

```

Logical Procedure PORTSTATUS(Subqueue);
Value           Subqueue;
Integer         Subqueue;
Option Privileged, Uncallable;

```

When supplied a valid subqueue number, PORTSTATUS returns a true value if the subqueue is non-empty and a false value if the subqueue is empty.

When passed a -1 a subqueue parameter, PORTSTATUS returns the subqueue number of the process' most urgent non-empty subqueue (the smaller the number, the more urgent the subqueue).

If all subqueues are empty, PORTSTATUS returns CC = CCE. If at least one subqueue is non-empty, PORTSTATUS returns CC = CCG.

RECEIVMSG

```

Procedure RECEIVMSG(Subqueue, MsgLength, Flags);
Value           Subqueue, MsgLength, Flags;
Integer         Subqueue, MsgLength;
Logical         Subqueue, MsgLength;
Option Privileged, Uncallable;

```

Subqueue and MsgLength has better be within range or a System Failure 622 will occur.

The caller of RECEIVMSG does an ASSEMBLE(ADD\$ MsgLength) to make space for the message contents. RECEIVMSG stores the message contents into Q-8, Q-9, ..., Q-7-MsgLength. Q-7-MsgLength contains the first word of the message.

Flags.(0:1) ==> do not release message from head of subqueue (non destructive read).

Return CC = CCG if all subqueues were empty, else CC = CCE.

G.00.00

Event 16 (X20)

Event Name: QUE_LDR
 Description: Called when an LDR is queued onto the CDT
 Calling Module: CRCHSEEG
 Calling Procedure: CDT'Queue'LDR

Parameter Description

P1 = Mapped Domain CDT entry number
 P2 = LDR entry index to be queued
 P3 = Queue type
 X12 - CDT impeded queue
 X13 - CDT active queue
 P4,P5,P6 Not used.

Event 17 (X21)

Event Name: DQUE_LDR
 Description: Called when an LDR is removed from the CDT queue.
 Calling Module: CRCHSEEG
 Calling Procedure: CDT'Dequeue'LDR

Parameter Description

P1 = Mapped Domain CDT entry number
 P2 = LDR entry index being removed from the queue
 P3 = Queue type
 X12 - CDT impeded queue
 X13 - CDT active queue
 P4,P5,P6 Not used.

Event 18 (X22)

Event Name: FIND_DE
 Description: Called when need to find an assigned CDT
 Device entry.
 Calling Module: CRCHSEEG
 Calling Procedure: CDT'Find'DE

Parameter Description

P1 = Ldev number of the CDT Device entry to be found.
 P2 = CDT Device entry
 P3,P4,P5,P6 Not used.

G.00.00

11		13
124		174
125	Password for user class 63	175
126		176
127		177

The PASSWORD TABLE occupies user labels number 1 and 2. There are four words (8 characters) reserved for each password. The relative position of a password corresponds to the user class number defined in the schema. For user class numbers not defined in the SCHEMA, the four word field is filled with blanks.

G.00.00
21- 5

Root File Label 3

WORD	LABEL #3	X
0	Item1 read/write bit map	0
1		1
2		2
3		3
4		4
5		5
6		6
7		7

17		21
119		167
120	Item16 read/write bit map	170
121		171
127		177

The ITEM READ/WRITE TABLE starts in user label #3. There are eight words for each ITEM READ/WRITE bit map. For databases with more than 16 items, the read/write table continues in the next user labels. The specific format of this table is explained after the SET READ/WRITE TABLE since it is defined the same way. The number of user labels occupied by the ITEM READ/WRITE TABLE depends on the number of data items defined in the schema and can be obtained by rounding upwards (ceiling) the result of:

$$\text{Num-of-labels} = \lceil (\text{Num-of-items}) * 8 \rceil / 128$$

Since there can only be a maximum of 255 data items in the schema, the maximum size for this table in user labels would be:

$$\text{Max-size} = \lceil (255) * 8 \rceil / 128 = 15.93 \Rightarrow 16 \text{ labels.}$$

G.00.00
21- 6

Root File- Next Label

WORD	LABEL #4	X

16	Set3 read/write bit map	20
17		21
119		167
120	Set16 read/write bit map	170
121		171
127		177

The SET READ/WRITE TABLE starts on a user label boundary after the ITEM READ/WRITE TABLE.

There are eight words for each SET READ/WRITE bit map. For databases with more than 16 data sets, the read/write table continues in the next user labels. The specific format of this table is shown in the next page.

The number of user labels occupied by the SET READ/WRITE TABLE depends in the number of data sets defined in the schema, and is obtained by rounding upwards (ceiling) the result of:

$$\text{Num-of-labels} = \lceil (\text{Num-of-sets}) * 8 \rceil / 128$$

Since there can only be a maximum of 99 data sets defined in the schema the maximum size for this table in user labels is:

$$\text{Max-size} = \lceil (99) * 8 \rceil / 128 = 6.18 \Rightarrow 7 \text{ labels}$$

G.00.00
21- 7

Item/Set Read/Write Table Format

There are eight words per item/set read/write table definition and up to 16 items/sets per record (user label). Within each 8 words, the first 4 words are the flags for the user classes which have read access to the item/set. The second 4 words are the flags for the user classes which have write access to the item/set. The detail format for an eight word field is shown below.

A. Four words for read access:

0 15 16 31 32 47 48 63
word_1 word_2 word_3 word_4

4 words represent 64 bits. Bit n represents read access for user class n to the item/set. If bit n is set to 1 then user class n has read access to the item/set.

For example, if the word settings are:

word 1 word 2 word 3 word 4
X000016 X020000 X000410 X001300

This means that user classes 12, 13, 14, 18, 39, 44, 54, 56 and 57 have read access to the item/set.

If no read/write security is defined at all for the item/set, then all of the read security bits are set to 1.

B. Four words for write access:

0 15 16 31 32 47 48 63
word_1 word_2 word_3 word_4

Write access flags have the same format as the read access flags. Bit n represents write access for user class n to the item/set. If bit n is set to 1, then user class n has write access to the item/set. For example, if the word settings are:

word 1 word 2 word 3 word 4
X000010 X020000 X000000 X001100

This means that the user classes 12, 18, 54 and 57 have write access to the item/set.

If no read/write security is defined at all for the item/set, then all of the write security bits are set to 0.

ROOT'DBSTATUS
(0:8) - IMAGE version ('B' in ASCII)
(8:8) - Binary 1 (filler)

ROOT'DBNAME - DATABASE name left justified (last 2 chars are blank).

NDWDOPEN - Number of data sets opened. This field is not used in IMAGE B.

MAXOPEN - Maximum number of data sets that can be opened. This field is not used in IMAGE B.

NOTE:

ROOT'ITEMPTR and ROOT'DSETPTR is a word offset from record 0 (beginning of the file, not including the space taken by the user labels) and can span several records. These pointers point to the 0th entry of the table and since the 0th entry in the item table or the set table does not really exist, they actually point to 11 words before the beginning of the table. To get to the first entry in the table, this pointer should be incremented by the length of the entry (which is currently 11 words).

20	reserved-2	item-type	24
21	subitem-count	subitem-length	25
22			26

The ITEM TABLE starts in record #1. Each entry is 11 words long and the length of the table depends on the number of data items defined in the schema. The relative position of an item definition depends on its relative position in the schema.

Item-name: is a data item name, left-justified and with trailing blanks

Item-number-of-synonym: is the number of the item whose name has the same hashed result as this one (this is utilized for quick item name searches).

Item-type: is one of the following: I, J, K, R, X, U, Z, or P

item-type
VALUES, 20J2;
subitem-length
subitem-count

The maximum size for this table is $11 \times 255 = 2805$ words.

NOTES:

The reserved-1 and reserved-2 fields are the 'old' level numbers for read and write security. Now, the values are always zero.

Set table follows the Item table.

Each entry is 11 words long. The length of the table depends on the number of data sets defined in the schema. The relative position of a set definition depends on its relative position in the schema.

Set-name: is a data set name, left-justified and with trailing blanks.

Set-number-of-synonym: is the number of a data set whose name has the same hashed result as this one (this is utilized for quick set name searches).

Data-set-type is one of the following: A, M or D.

DSCB-pointer: is a pointer to the Data Set Control Block. This pointer is word offset from record #0. The DSCB is described ahead.

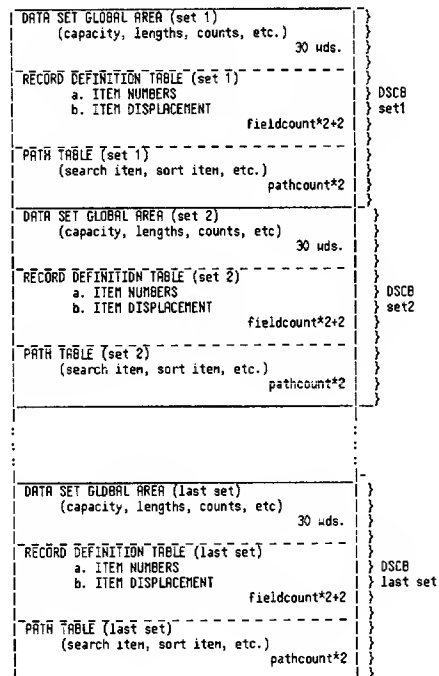

The maximum size for this table is $11 \times 99 = 1089$ words.

NOTES: The reserved-1 and reserved-2 fields are the 'old' level numbers for the read and write access respectively. Since this concept no longer applies, the values are set to zero.

6.00.00
21- 11

General Rootfile Layout

Data Set Control Blocks (DSCB)- General Layout

The DSCBs follow the SET TABLE in the Root file. There is one DSCB for each data set defined. The function of the DSCB is to define each data set within the data base.

- DSCRAP - data set capacity as reported by the SCHEMA processor.
- DSBLOCKLGH - data set block length including the bit map overhead.
- DSMEDIRLGH - data set media record length (remember that this length includes the pointer overhead)
- DSENTRYLGH - data set entry length.
- DSBLOCKFRC - data set blocking factor.
- DSFIELDCT - data set field count. This is the number of fields specified for the data set.
- DSPTHCT - data set path count. This is the number of paths that are specified for the data set.
- X-DSKEYTYPE - data set key type. If DSKEYTYPE = TRUE then the key is hashed.
- DSPRIMKEY - data set primary path or key.
For master data sets, this is the field number of the search item.
For detail data sets, this is the field number of the primary path.
- DSPTHPTR - data set path table pointer. Word offset to the data set path table which contains an entry for each path defined. It points to path 0th entry in the table, so to get to the first entry the pointer should be incremented by the length of the entry (which is currently 2 words).

15

This table immediately follows the Item Numbers Table.

The word offset points to the starting location of the field within the media record. Remember that the media record includes the pointer overhead so this offset varies for master and detail data sets: if a master data set has only one path, the word offset for the first field is 10, since there are 10 words of overhead—5 words for the synonym chain pointers and 5 words for the data set chain head that it would be pointing to. On a detail data set with one path, the overhead is only 4 words.

The 'length-of-entry' field is the same as the media record length.

G.00.00

There are 2 words (4 bytes) for each path definition.
The PATH TABLE for master data sets has a different layout from the PATH TABLE for detail data sets.

Master sets:

Byte Description

- 1 - item number of the search item in the related detail set.
- 2 - item number of the sort item in the related detail set.
- 3 - set number of the related detail data set
- 4 - path number of the corresponding path in the related detail data set.

Detail sets:

Byte Description

- 1 - field number of the search item.
- 2 - field number of the sort item.
- 3 - set number of the related master data set
- 4 - path number of the corresponding path in the related master data set.

General Data Set Layout

Word	USER_LABEL_0
0-1	masters=capacity details=highwater mark
2-3	number of unused records
4-5	masters= not used details= delete chain head

G.00.00

21- 15

General Rootfile Layout

Data Set User Label 0

- Word 0-1: Record name of the highest readable record. For Masters, this is the highest record in the set (i.e. Capacity). For Details, this is the greatest number of records that have been written to the set thus far. For example, if there is room in the Detail data set for 100 records and 75 were written last week when the data set was loaded with DBLDRD, and yesterday 15 records were deleted from the data set, the "High Water Mark" is equal to a value of '75'.
- Word 2-3: Number of unused records in the data set. This field is incremented when a record is deleted and decremented when a record is added. To determine the current number of entries used in the set subtract Word 1-2 (unused count) from Word 0-1 (capacity).
- Word 4-5: The delete chain head for Details. This points to the record most recently deleted or contains a value of zero if no records have been deleted. This field is not used in Master data sets.

Data Set Records

The data in the data set records is arranged according to the Media records. These are formatted by the Schema Processor (DBSCHEMR).

G.00.00

21- 16

CHAPTER 22 DISC FREE SPACE MAP

Disc Resident Data Structures

There are two disc resident free space data structures, the bit map and the descriptor table, for each disc volume that has a free space map, i.e. system discs and private volumes. The addresses of these data structures are kept in the disc label. The symbols that define the descriptor table and bit map are in the include file INCLDFPS2.

Bit Map

The bit map is divided up into pages, which is the physical block of the map that is read or written. At the moment, a page is defined to be one sector (128 words) long, this may be changed by changing a compile time constant. The last word of the page is a checksum for that page, all other words are data. There is a one to one correspondence between bits in the map and sectors of the disc. A one bit represents a free sector and a zero bit represents an allocated sector. The bit map is a contiguous set of pages, enough to represent the entire disc, excluding spare tracks and spare sectors.

Descriptor Table (DT)

The descriptor table is an array of three word entries, one entry for each page of the bit map. Each entry looks like this:

```

=====
=                                     =
word 0 = largest space =             =
=====
=                                     =
word 1 = starting space =             =
=====
=                                     =
word 2 = ending space =               =
=====

```

Thus the descriptor table looks like this.

```

-----
= entry for page 0
-----

```

G.00.00
22- 1

```

= entry for page 1
-----
= entry for page 2
-----
= entry for page 3
-----
.
.
.
= entry for last page
-----

```

Each entry describes the free space on the corresponding page of the bit map. The largest space word is the size of the largest contiguous block of free space on the page, which is not at the very beginning or very end of the page. That is, the first bit physically representing the space is not the first bit of data on the page or the last bit representing the space is not the last bit of data on the page. Starting space is the number sectors of contiguous space represented by the set of bits whose first bit is the first bit of data on the page. Ending space is the number of sectors of contiguous space represented by the set of bits whose last bit is the last bit of data on the page. The starting space and ending space fields allow looking across page boundaries, thus preventing fragmentation on page boundaries. Thus, if all sectors represented on a page are free, then starting and ending space will be the same and have the total number of free sectors represented on the page. Largest space will be zero, as there is no block of space that is not at the beginning or end of the page. A value of - 1 for all the fields in an entry indicates the corresponding page is bad, either from a checksum or I/O error.

Virtual Memory Resident Data Structures

For each system disc or physically mounted private volume there is a data segment which has information about the disc free space map, the current copy of the descriptor table, some work space for the procedures while in split stack mode and buffers for pages of the bitmap. The DST number of the data segment for a given disc is found in the LDTX entry for that disc.

Disc Free Space Data Segment

For each system disc or physically mounted private volume in the up and running system there is a DST which contains information about the disc free space map for that disc, some work area, a copy of the descriptor table and buffers for the pages of the bit map. All symbols that define these data segments are in the include file INCLDFPS2, and they are prefixed with "ds". The structure of the data segment is as follows:

```

=====
0 (X0) = ds'ldv =

```

G.00.00
22- 2

```

-----
1 (X1) = ds'dst =
-----

30 (X36) = ds'entry'type =
-----
31 (X37) = ds'buffer'index =
-----
32 (X40) =
-----
33 (X41) = ds'disc'address =
-----
34 (X42) = ds'error'status =
-----

```

The rest of the data segment contains tables whose size and location is dependent on the size of the disc and or the number of buffers in the data segment. They are shown below just to demonstrate there relation to one another, for there actual location, the pointers should be examined. The symbol "ds'array'area" defines the start of the area. The first table is the descriptor table, it is in the same format as the disc copy, but a dummy entry of all zeros is added before and after the table, these are needed by procedures "FindPage" and "BuildDescriptorEntry". The pointer to this table is "ds'descriptor'table", it points to the entry for page zero, not the dummy entry.

G.00.00
22- 4

Disc Free Space

```

=====
= 0 =
=-----= dummy
= 0 =
=-----= entry
= 0 =
=====
= largest space =
=-----= entry for

=-----= entry for
= starting space =
=-----= last page
= ending space =
=====
= 0 =
=-----= dummy
= 0 =
=-----= entry
= 0 =
=====

```

The next table is ds'buffer'page'number table, it has a one word entry for each buffer in the data segment. Each entry contains the page number of the page currently in the corresponding buffer or -1 if the buffer is empty. This is pointed to by "ds'buffer'page'number".

```

=====
= buffer 0 entry =
=====
= buffer 1 entry =
=====
:
:
=====

```

G.00.00
22- 5

Disc Free Space

```

=====
= last buffer entry =
=====

```

The next table is the ds'buffer'dirty table, which has a one word entry for each buffer. A TRUE indicates the page in the corresponding buffer is dirty, i.e. the disc copy is not up-to-date. A FALSE indicates that the buffer is clean. If DFS was compiled with dirty buffer management turned off, this table is not present and the ds'buffer'dirty pointer is zero.

```

=====
= buffer 0 entry =
=====
= buffer 1 entry =
=====
:
:
=====
= last buffer entry =
=====

```

The remainder of the data segment contains the buffers, each buffer is the size of one page of the bit map, which is currently one sector(128 words). The beginning of the buffer area is pointed to by "ds'buffer'area" and the number of buffers is the value in "ds'last'buffer'index" plus one.

```

=====

Disc Free Space

```

:
:
=====
=
=
= last buffer
=
=
=====

```

Each of the fields of the data segment is described in the include file INCLDFS1, where they are defined. It should be noted that the following fields are just workspace, used to pass information between procedures while in split stack mode and have no meaning between calls to the disc free space management subsystem:

ds'page'number	ds'word'number
ds'bit'number	ds'page'ptr
ds'starting'word'number	ds'starting'bit'number
ds'number'of'sectors	ds'entry'type
ds'bit'count	ds'buffer'index
ds'disc'address	

The field ds'error'status normally has no meaning between calls unless the error'type field has a value greater than "fatal'dfs'error", in which case it means that disc space may no longer be allocated on this disc.

G.00.00
22- 7

CHAPTER 23 MPE DISC CACHING

Disc Caching Overview

Disc Caching is an optional feature of MPE that utilizes excess main memory and excess CPU horsepower to keep portions of frequently referenced disc "domains" in memory. (A disc "domain" is a copy of a portion of disc residing in main memory. These disc domains are considered "cached" when they are in memory and are considered "mapped" when there is I/O pending against them.) Disc Caching manages the bi-directional transfer of these disc domains between main memory and disc storage. No main memory is permanently dedicated to cached disc domains. Cached disc domains share main memory with all other types of MPE segments and are not treated differently by the memory manager. By keeping cached disc domains in memory, a significant portion of the references to disc storage can be resolved without actually having to physically access the disc. Disc Caching policies are integrated into the MPE Kernel, File System, and I/O System which allows the system performance to be tuned based on the current workload and resource availability.

Disc Caching uses the MPE kernel resource management mechanisms and strategies. These mechanisms are extended to handle cached disc domains in the same manner as segments. Thus, cached disc domains can be of variable size, fetched in parallel with other segments or cached domains, garbage collected, and replaced in the same manner as stacks, data and code segments. The relative use of main memory between stacks, data and code segments, and cached disc domains is dynamic. This partitioning is based on the workload's current requirements and current memory availability.

Disc Caching can be enabled/disabled on a disc by disc basis. When caching is enabled for the first disc, the code segment containing the Disc Caching code will be locked into memory. Also at this time the Cache Directory Table (CDT) will be built and locked into memory. When caching is disabled for the last disc, the code segment will be unlocked from memory and the CDT will be released. Thus if caching is not enabled no memory will be wasted.

The CDT is used to keep track of the following information:

- 1) The disc ldevs currently enabled for caching. There will be a Device Entry in the table for each cached disc.
- 2) A linked list of cached domains for each disc with caching enabled. The head and tail of this linked list will be contained in the Device Entry. (I.e. there is a separate linked list of cached domains for each cached disc ldev.)
- 3) The cached domains that currently have user I/O pending (i.e. FREADS/FWRITES) or have memory management I/O pending (i.e. fetching the disc domain into memory, or posting the disc domain back out to disc). There will be a Mapped Domain Entry in the table for each disc domain that has that I/O pending and is thus "mapped".

5.00.00
23- 1

- 4) A linked list of all user I/O pending against the mapped disc domains. There will be a Logical Disc Request (LDR) queued to the Mapped Domain entry that will describe the user I/O to take place. This is analogous to a Disc Request queued to a specific DIT waiting for service.

When a request is made to access disc information, Disc Caching must first determine if the requested disc domain is present in memory. Disc Caching will first determine if the requested area of disc is already mapped into memory by scanning through the Mapped Domain entries of the CDT. If the requested transfer can be satisfied with a currently mapped disc domain, then the I/O request will be queued (FIFO) behind the other I/Os pending against that mapped domain. If the requested area is not already mapped, then a search is made through the linked list of cached disc domains for the specified disc ldev. (The region header contains the disc address and size that a disc domain represents.) If the requested domain is found in this list (i.e. present in memory), then this region will be mapped. A domain is then considered mapped when there is an entry for it in the Mapped Domain portion of the CDT. Mapping the domain allows Disc Caching to manage the I/O pending and/or currently active for a particular disc domain. Once the disc domain is mapped and present, the data can be moved between the process' data area and the mapped disc domain. The process can then continue executing without interruption or a process switch. The user/subsystem process for which the move is done will be charged with the CPU overhead.

When a request is made to read data that is not currently cached in memory (i.e. a read "miss"), the fetch strategy uses the File System's knowledge of the type of access (sequential or random), the extent size of the file, along with the current memory load to select the optimal size of the disc domain to be fetched and mapped into memory. The fetch of the disc domain is then initiated on the user's stack without a process switch. After the fetch is initiated, it completes in an unblocked manner so that this process (if no-wait I/O) or another process can proceed in parallel with the cache fetch.

In general, when writing, a process will not wait for completion of the physical I/O. Instead, the process will be awakened as soon as the transfer has completed between the process's data area and the mapped disc domain (i.e. no-wait-for-post). The physical I/O will then be posted at background priority while the process continues. (Users can specify wait-for-post on a file by file basis in place of the default no-wait-for-post with the FSETMODE intrinsic. This can be done on a global basis via :CACHECONTROL.) If the access request is a write and there is a current write pending against the specified mapped disc domain, the process request is queued until the pending write is posted to disc. If the disc domain to be written is not currently cached in memory, a free piece of memory will be obtained to map the corresponding disc image and then the "write" takes place from the process' data area to the mapped disc domain. This prevents data from having to be read before being written. After that, a post to disc is initiated (on any write only the portion of a mapped disc domain that is modified will be posted to disc). After the move to the mapped disc domain is complete and the post to disc is initiated, the process performing the "write" is allowed to continue to run without having to wait for the post to complete. Writes that must be posted to disc in a certain order use the Global Serial Write Queue. These

5.00.00
23- 2

ordered writes include things like updating disc free space maps for a new file extent before updating the file extent map in the file label.

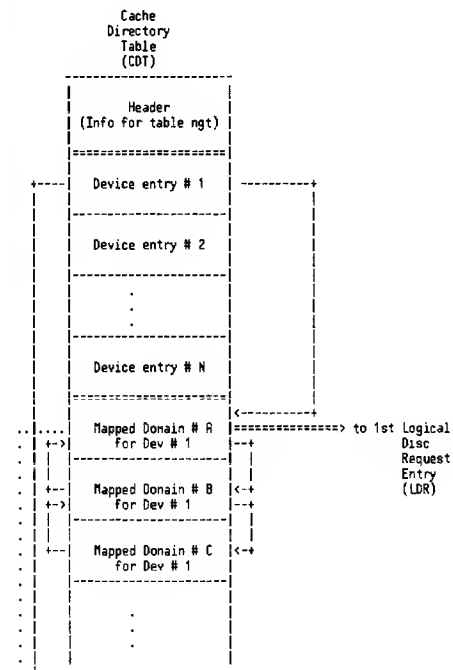

There are two disc request entries used for disc caching requests. The first entry is a Logical Disc Request (LDR) entry and is used to manage the data moves to/from the user's data area and the disc domain (i.e. the logical I/O). The second entry is a regular Disc Request (DRQ) entry and is used to perform the physical I/O necessary to map a disc domain (for a read "miss") or to perform the physical post (on write requests). The disc domain will remain mapped until both the logical and physical I/O completes. If a request is not completely described by one disc domain already in memory or a Mapped Domain CDT entry (i.e. the requested disc area falls into more than one disc domain) then the overlapping disc domain(s) will be flushed to disc and the new complete disc domain will be fetched (if read) and mapped - no partial mappings are allowed.

The DSI number of the Cache Directory Table (CDT) is at X1273 and the bank and offset are kept in X1274-X1275. The Caching Sir (2) is used when starting and stopping caching (via :STARTCACHE/:STOPCACHE) and by the LDRADER when loading a program file (this sir is only used when updating the STT at load time).

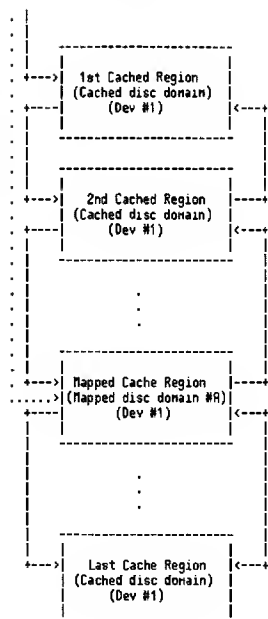

When caching is enabled for a disc, a bit in the flags word of the DIT is set. Also, the Global Serial Write queue can be found by examining the header entry of the Disc Request Table. See Chapter 13 for a more detailed explanation of both the DIT and the Disc Request Table header. See Chapter 2 for a description of the Memory Region Header for a disc domain (cached region).

Disc Caching Tables Overview

5.00.00
23- 4

Memory Regions

G.00.00
23- 5

Cache Directory Table

The Cache Directory Table (CDT) is the bookkeeping structure for managing cached disc domains. This table is divided into 3 parts:

CDT Header Entry

This entry contains all information necessary to manage the entire table and also contains global caching related information.

CDT Device Entry

There will be one of these entries for every disc ldev that currently has caching enabled. These entries keep track of all cached disc domains in memory for this device. In addition, these entries contain statistics regarding the number of I/Os performed to the ldev.

CDT Mapped Domain Entry

These entries describe disc domains that are currently "mapped" into memory. This means that there is logical I/O (cache move) and/or physical I/O (fetch or post) pending. These entries keep track of the state of the cached disc domain (INI, RDC, etc.) just as the DST Table keeps track of data segments.

The following low core cells contain the address of the CDT:

X1273 contains the DST Number of the CDT
X1274 contains the Bank Number of the CDT
X1275 contains the Offset within the bank of the CDT

G.00.00
23- 6

	.	
X27	.	

G.00.00
23- 7

CDT'ENTRIES

The total number of CDT entries configured in this table (i.e. includes all three types of entries). The number of entries in the table will be:

- + 1 entry for the header
- + 1 entry for each disc ldev configured.
(CDT Device entries)
- + 1 entry for each DRQ configured.
(CDT Mapped Domain entries)

This scheme insures that this table can never overflow (since an entry in the DRQ table is always obtained before an entry in this table).

CDT'SIZE

Size of each entry in the table.

CDT'FREE'COUNT

Total number of entries currently unassigned.

CDT'FREE'NERD

Table relative offset (i.e. Entry number * entry size) of the first available entry.

CDT'FREE'TRIL

Table relative offset of the last available entry.

CDT'MAX'USED

The maximum number of entries in use at one time.

CDT'NUM'LDEVS

The number of ldevs currently cached.

CDT'DISC'NERD

The entry number of the first Device Entry.

CDT'DST'WORDS

The total number of words in this data segment.

CDT'STOP'PND

This value will be TRUE if there is a pending :STOPCACHE.

CDT'SEQ'MINFTCH

If there is a prefetch for a sequential read ("miss"), the size of the prefetch is delimited by the extent size of the file. Within this limitation, the prefetch is equal to the greater of two sizes:

- 1) Requested size.
- 2) The largest integer multiple of the request size that is smaller than the value found in this cell.

The default value is 96 sectors. (This value may be changed via :CRCHCONTROL).

CDT'RD'MINFTCH

This is the same as CDT'SEQ'MINFTCH except that it is for random access. The default value is 16 sectors. (This value may be changed via :CRCHCONTROL).

G.00.00
23- 8

Disc Caching

CDT'FORCE'POST

When this value is TRUE, all writes will "block" until the physical update on disc complete. The syeten default is FALSE. (Can be altered via :CACHECONTROL).

CDT'STOP'QUEUE

IF CDT'STOP'PENDING is TRUE this will be the PIN number of the head pin of the processes impeded until the :STOPCACHE completes.

G.00.00
23- 9

Disc Caching

Device Entry

0	Next ldev entry (entry number)	CDT'DE'NEXT'LDEV
1	Prev ldev entry (entry number)	CDT'DE'PREV'LDEV
2	Ldev for this disc	CDT'DE'LDEV

X26	Memory address of last referenced domain	CDT'DE'SCRAPT

G.00.00
23- 10

Disc Caching

CDT'DE'NEXT'LDEV

The entry number of the next Device Entry.

CDT'DE'PREV'LDEV

The entry number of the previous Device Entry.

CDT'DE'LDEV

The Ldev number for this cached device.

CDT'DE'MAPD'PAGES

Total number of main memory pages allocated to disc domains for this cached device. This includes mapped and unmapped regions. (1 main memory page = 128 words).

CDT'DE'MAPD'CNT

The total number of Mapped Domain entries associated with this Device Entry.

CDT'DE'MAPD'HEAD

The entry number of the first Mapped Domain entry for this device.

CDT'DE'MAPD'TAIL

The entry number of the last Mapped Domain entry for this device.

CDT'DE'REGIONS

The total number of disc domain regions for this ldev (includes mapped and unmapped regions).

CDT'DE'REG'HD

Memory address to the head region of the disc domain linked list. Disc domain regions are linked in order based on the disc address they represent (i.e. small disc address at head, large disc address at tail). This address will not point to the region base (RB), but to the next domain (ND) field of the region header. (This is to facilitate the use of the LLSH instruction).

CDT'DE'REG'TL

Memory address of the tail region of the disc domain linked list. This address will be of the previous domain (PD) field of the region header.

CDT'DE'RHIT

Total number of times that a read was requested and the requested disc domain was present in memory - i.e. a read "hit". This means that the read completed without performing any I/O (to fetch the domain). Thus this is actually the number of read I/Os eliminated. This value will reset to zero on overflow.

CDT'DE'WHIT

Total number of times that a write was requested and the requested disc domain was present in memory - i.e. a write "hit". If there was no other write pending to the "hit" domain, then the process would continue as soon as the cache move completes - thus eliminating a block for I/O. Otherwise, the process would block waiting for the first write to complete. This value will reset to zero on overflow.

G.00.00
23- 11

Disc Caching

CDT'DE'RMIS

Total number of times that a read was requested and the requested disc domain was not in memory - i.e. a read "miss". This means that the requested disc domain had to be fetched into memory before the read could complete - thus potentially blocking the process. This value will reset to zero on overflow.

CDT'DE'WMIS

Total number of times that a write was requested and the requested disc domain was not in memory - i.e. a write "miss". This does not mean that the process would block until the disc domain is fetched as is the case for reads. Rather, a free memory region would be obtained to be the destination of the cache move. This disc domain would then be posted in the background (unless overridden via :FORCECONTROL or REEMODE) allowing the process to continue without blocking. This value will reset to zero on overflow.

CDT'DE'STOP

Total number of times that a process had to block on a cache transfer. Will reset to zero on overflow.

CDT'DE'SCRAPT

The memory address of the last region looked at on a search. This address will be of the next domain (ND) field of the region header. This value will be used along with CDT'DE'REG'HD to determine where to start the next search for a cached disc domain. At times it will be more efficient to start with this address since the disc domain requested may be of a higher disc address than found in this region header, rather than always starting the search with CDT'DE'REG'HD.

G.00.00
23- 13

CDT'MD'PREV

Entry number of the previous mapped domain entry for this device.

CDT'MD'NEXT

Entry number of the next mapped domain entry for this device.

CDT'MD'SECTOR

The starting disc sector address representing this mapped domain entry.

CDT'MD'END'SECTOR

The ending disc sector address representing this mapped domain entry.

CDT'MD'FLAGS

Flags describing the state of this mapped domain entry and the region associated with it:

- (0:1) - ABSENT.
Region is not present in memory.
- (1:1) - INI.
Region is already In-Motion-In. (Set when the fetch for this cached region is initiated).
- (2:1) - IND.
Region is In-Motion-Out. (Set by STARTOBJWRITE when performing the background post of a cached region).
- (3:1) - MISS.
This disc domain was not present and had to be prefetched.
- (4:1) - LOCK. Not used.
- (5:1) - FWIP.
Forced Write In Progress. Region was forced out of memory to make room for another object.
- (6:1) - ROC.
Recover Overlay Candidate. Region may be forced out of memory to make room for another object. However, if this region is referenced again it can be recovered.
- (7:1) - VIRGIN.
Clean region in the write state. Cleared as soon as a move completes. (I.e. if this bit is on, then a write can complete immediately. Otherwise the write will have to wait until the current write completes the physical post).
- (8:1) - NOPOST.
Set when the CDT is being posted out as a result of a write request that did not want to wait for the physical post to complete. This will be cleared by the cache completor when the physical post completes. (This is used to insure that a cache move for any subsequent write request will not be serviced until the physical post completes.)
- (9:1) - SEQ.
Set if doing sequential I/O. When the request for the last area of this disc domain is complete, this domain will be made a ROC.
- (10:3) - Not used.
- (13:3) - STATE.
0 - AVAIL. CDT is an available entry.

G.00.00
23- 14

- 1 - READ. Only read LDR(s) are attached.
- 2 - WRITE. Write LDR(s) and possibly read LDR(s) are attached.
- 3 - FLUSH. CDT is being flushed out.
- 4 - LOCK. Unused.

CDT'MD'READ'CNT

The number of LDRs attached that are for reads (move not complete).

CDT'MD'WRITE'CNT

The number of LDRs attached that are for writes. NOTE: This count will not be decremented until both the cache move and the physical write completes. However, as soon as the cache move completes, the LDR will be dequeued from the CDT.

CDT'MD'LKD'CDT

Not used.

CDT'MD'IMPED'HD

The first LDR that is impeded. (I.e. the CDT is in a write state already and another write is attached. The second write will be placed in this queue until the first write completes.)

CDT'MD'LDR'HEAD

The first LDR that is on the active list for this CDT.

CDT'MD'MEM'RDR

The memory address (region base) for this mapped disc domain, if present.

CDT'MD'DISCREQ

The disc request table index associated with this mapped disc domain. This will be used to fetch this region in, or to post this region after any logical I/Os (writes) have completed. (I.e. this DRQ is used for the physical I/O.)

CDT'MD'LK'CNT

Not used.

CDT'MD'LDEV

The ldev number for this mapped domain.

CDT'MD'IMPEDED

The PIN for the first process impeded on this mapped disc domain. Processes get impeded here when they do WAITFORIO when their LDR is on the CDT impeded queue and the Mapped Domain is currently being written out. (This will also happen upon a :STOPCRCHE to force all LDRs to complete.) As soon as the physical post of the Mapped Domain is complete, all processes impeded here will be awakened.

CDT'MD'DE

The entry number for the Device entry that this Mapped Domain entry is associated with.

G.00.00
23- 15

Logical Disc Request Table

X1017 Pointer to Logical Disc Request Table

NOTE:

This table is really part of the DRQ (Chapter 13). Any entry with the logical request bit set in the flags will conform to this format and not the format of the standard DRQ.

Logical disc requests entries are used to manage requests between the requesting process and a mapped disc domain. They are the counterpart of disc requests entries used to manage physical I/O requests between a process and a disc. These entries are kept as part of the DRQ Table, but will never be queued to the disc's DIT, instead they will be queued to the mapped disc domain CDT entry. LDR entries may only be placed onto the following queues:

- 1) The CDT active list.
- 2) The CDT impeded LDR list.
- 3) The Disabled Disc Request. (This will only happen if the buffer segment is absent when the logical I/O (cache move) is attempted.)

NOTE:

LDRs are singly linked onto the CDT queue and doubly linked onto the disabled disc request queue.

LDR'F LAGS

```

LDN_FLAGS
Flags:
(0:3) - Not used.
(3:1) - SEUF.
        Set if request is to/from a System Buffer.
(4:1) - IOWAKE.
        Set when the system should wake up the process when the logical
        I/O completes.
(5:1) - BLOCKED.
        Set if the process wants to wait for the logical disc
        request to complete.
(6:1) - DONE.
        Set when the logical disc request is complete and the
        process will be awakened (if IOWAKE is set)
(7:1) - DO'POST.
        Set if the caller wants to be waited until the physical
        post to disc completes. Only valid for write requests.
(8:1) - SERIAL'POST.
        Set when the physical post should be through the Global
        Serial Write queue.
(9:1) - CDT'QUEUED.
        This request has been queued - either onto the CDT active
        queue (see CDT Mapped Domain entries) or onto the disabled
        disc request list.
(10:1) - MOVE'DONE.
        The move has been completed, but the process won't be
        awakened until the DONE bit is set.
(11:1) - Not used.
(12:1) - CUR'REQ.
        Set if this request is the current/active request.
(13:1) - DISABLE.
        Set if the request is disabled.
(14:1) - LDR'REQ.
        Set if this is a logical disc request.
(15:1) - LDR'INLOC.
        Set if Mapped Domain CDT entry is in process's locality
        list.

```

LDA'L'NODR
The High Order Disc Address of the extent limit. (See note with LDA'8'NODR).

LDR' LDEV
The ldev for this request.

LDR'CDT
The CDT number for the Mapped Domain entry associated with this request.

LDA'BUFDST
Data Segment number for the target of the logical I/O request. If bit zero is set, then this is the process's stack.

LDA'BUFADA
Offset within the DST (above) for the target address. If the DST is the process's stack, then this address will be DB relative.

G.00.00
23- 18

LDA'S TRAT' FUNC

```

LDA Simult From
(0:8) Strategy
0 - Unknown caller
1 - Unknown File System
2 - Spooler
3 - Directory
4-7- Unknown caller
8 - Genmessage
9 - File System, Quiesce I/O
10 - File System, Sequential, No Buf
11 - File System, Direct, No Buf
12 - File System, Sequential, Buffered
13 - File System, Direct, Buffered
14 - File System, KSAM
15 - File System, TNAME

```

(8:8) - Function
0 - Read
1 - Write

LDR'COUNT
On initiation, this specifies the requested transfer count (+words, -bytes).
At completion of the request, this contains the actual transmission count
(+words, -bytes).

LDR'PARAM1
This is the High Order Disc Address of the requested disc sector.

LDR'PARM2
This is the Low Order Disc Address of the requested disc sector.

LDA' STATQ
Uniform status returns.

LDR'PCB
PIN of the requesting process.

LDR'PREVQ
Table relative index of the previous LDR in the queue. (NOTE: LDRs are singly linked on the CDT queues, and doubly linked on the disabled disc request queue).

LDR'NEXTQ
Table relative index of the next LDR in the queue.

LDR'B'HODA
The High Order Disc Address of the extent base. (Used when the logical disc request is through the file system. Caching uses this information when searching memory for a "hit" on a cached domain).

LDR'B'LODR
The Low Order Disc Address of the extent base. (See note above).

LDR'L'LODA
The Low Order Disc Address of the extent limit. (See note above).

READER COMMENT SHEET

MPE V Tables Manual for MPE V/E, Version G.00.00

32033-90010

September 1984

We welcome your evaluation of this manual. It is one of several that serve as a reference source for HP 3000 Computer Systems. Your comments and suggestions help us to improve our publications and will be reviewed by appropriate technical personnel. HP may make any use of the submitted suggestions and comments without obligation.

Is this manual technically accurate? Yes ☐ No ☐ (If no, explain under Comments, below.)

Are the concepts and wording easy to understand? Yes ☐ No ☐ (If no, explain under Comments, below.)

Is the format of this manual convenient in size, arrangement and readability? Yes ☐ No ☐ (If no, explain or suggest improvements under Comments, below.)

Comments:

We appreciate your comments and suggestions. This form requires no postage stamp if mailed in the U.S. For locations outside the U.S., your local HP representative will ensure that your comments are forwarded.
